Ack. : Data and algorithms from ECMWF kindly provided by P. Bauer. TMI data provided by N. Viltard.

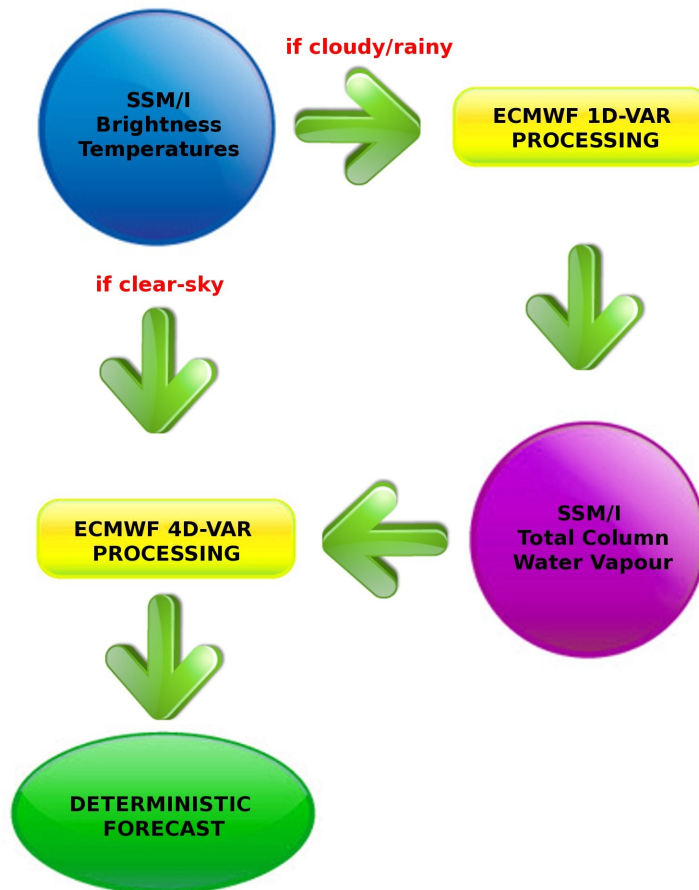

Motivation for this study

- NWP, and more specifically TC forecasting, is highly dependent on satellite observations
- These observations are usually not assimilated in cloudy and/or rainy conditions
- Assimilation of rainy satellite radiances proves very costly (complex obs operators)

Methodology (1/3): Rainy SSM/I at ECMWF

The characterization of the cloudy/rainy condition is purely observation-based. Namely:

- If $TB_{37H} - TB_{37V} < 40$ K, the pixel is considered rainy.
- If $LWP > 0.01$ kg.m⁻², the pixel is considered cloudy; with

$$LWP = A_0 + A_1 * \log(280 - TB_{22V}) - A_2 * \log(280 - TB_{37H})$$

where $A_0 = 4.2993$, $A_1 = 0.399635$ and $A_2 = -1.406920$

Methodology (2/3): Retrieving the algorithm

Goal : Find a simple, statistical approach to link satellite radiances to the TCWV

cloudy/rainy

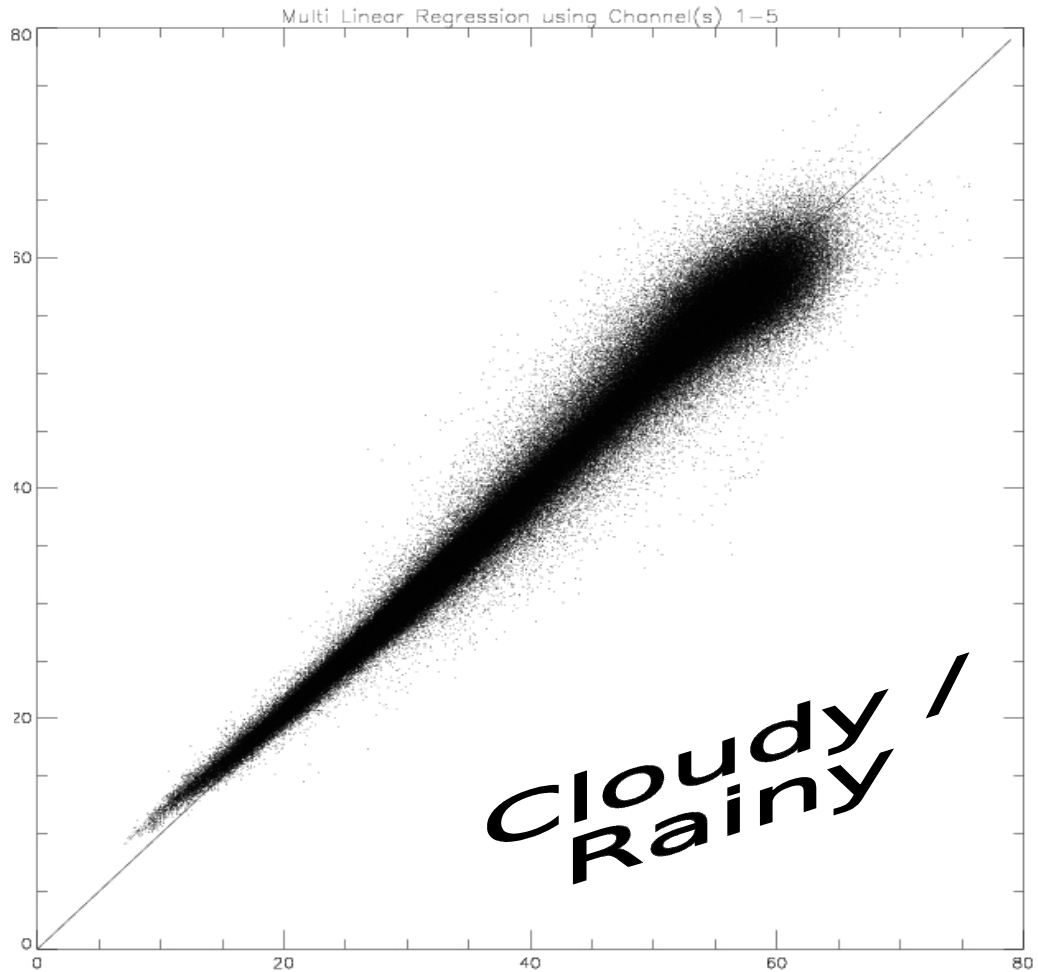

cloudy/rainy

$$TCWV_{predicted} = \alpha_0 + \sum_{i=1}^5 \alpha_i * \ln(290 - TB_i)$$

- One algorithm per SSM/I satellite
- Learning period from Nov 27, 2006 until Feb 11, 2007. Area is the SWIO.
- 250000 to 350000 points
- 3 TC and 1 Tropical Storm sampled

RETRIEVED TCWV

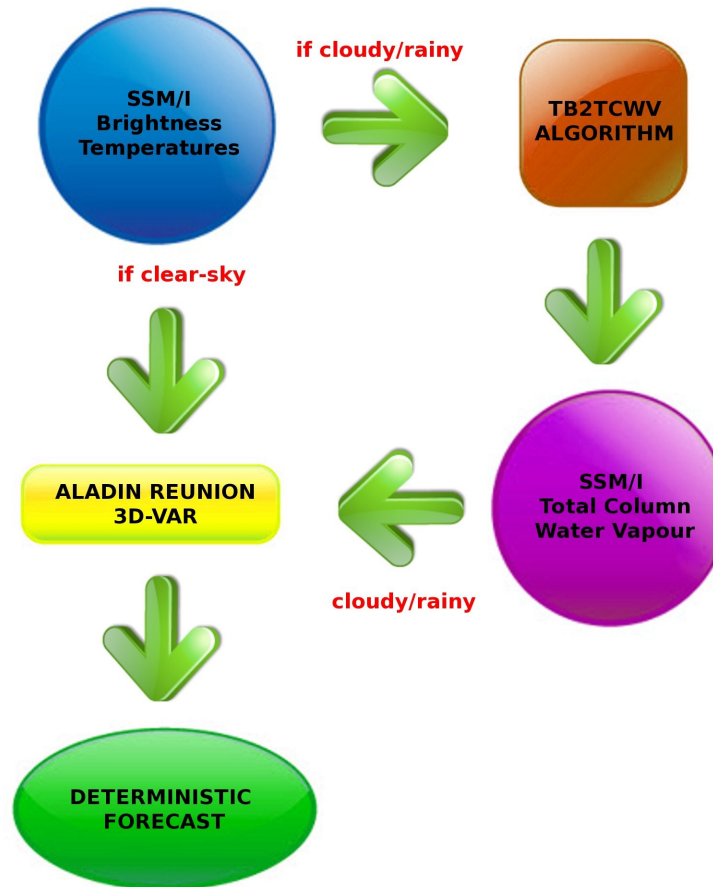

ECMWF TCWV

➤ Std dev < 2.2 kg/m² ; Correlation > 0.985

Methodology (3/3): Applying the algorithm

- The obtained TCWV is then assimilated in the ALADIN Reunion model (10km resolution, covers the SWIO)
- A 3D wind bogus following the UKMO technique (Heming, 1995) is used for cyclonic cases
- Several experiments were ran with the combination of TCWV and the 3D wind bogus

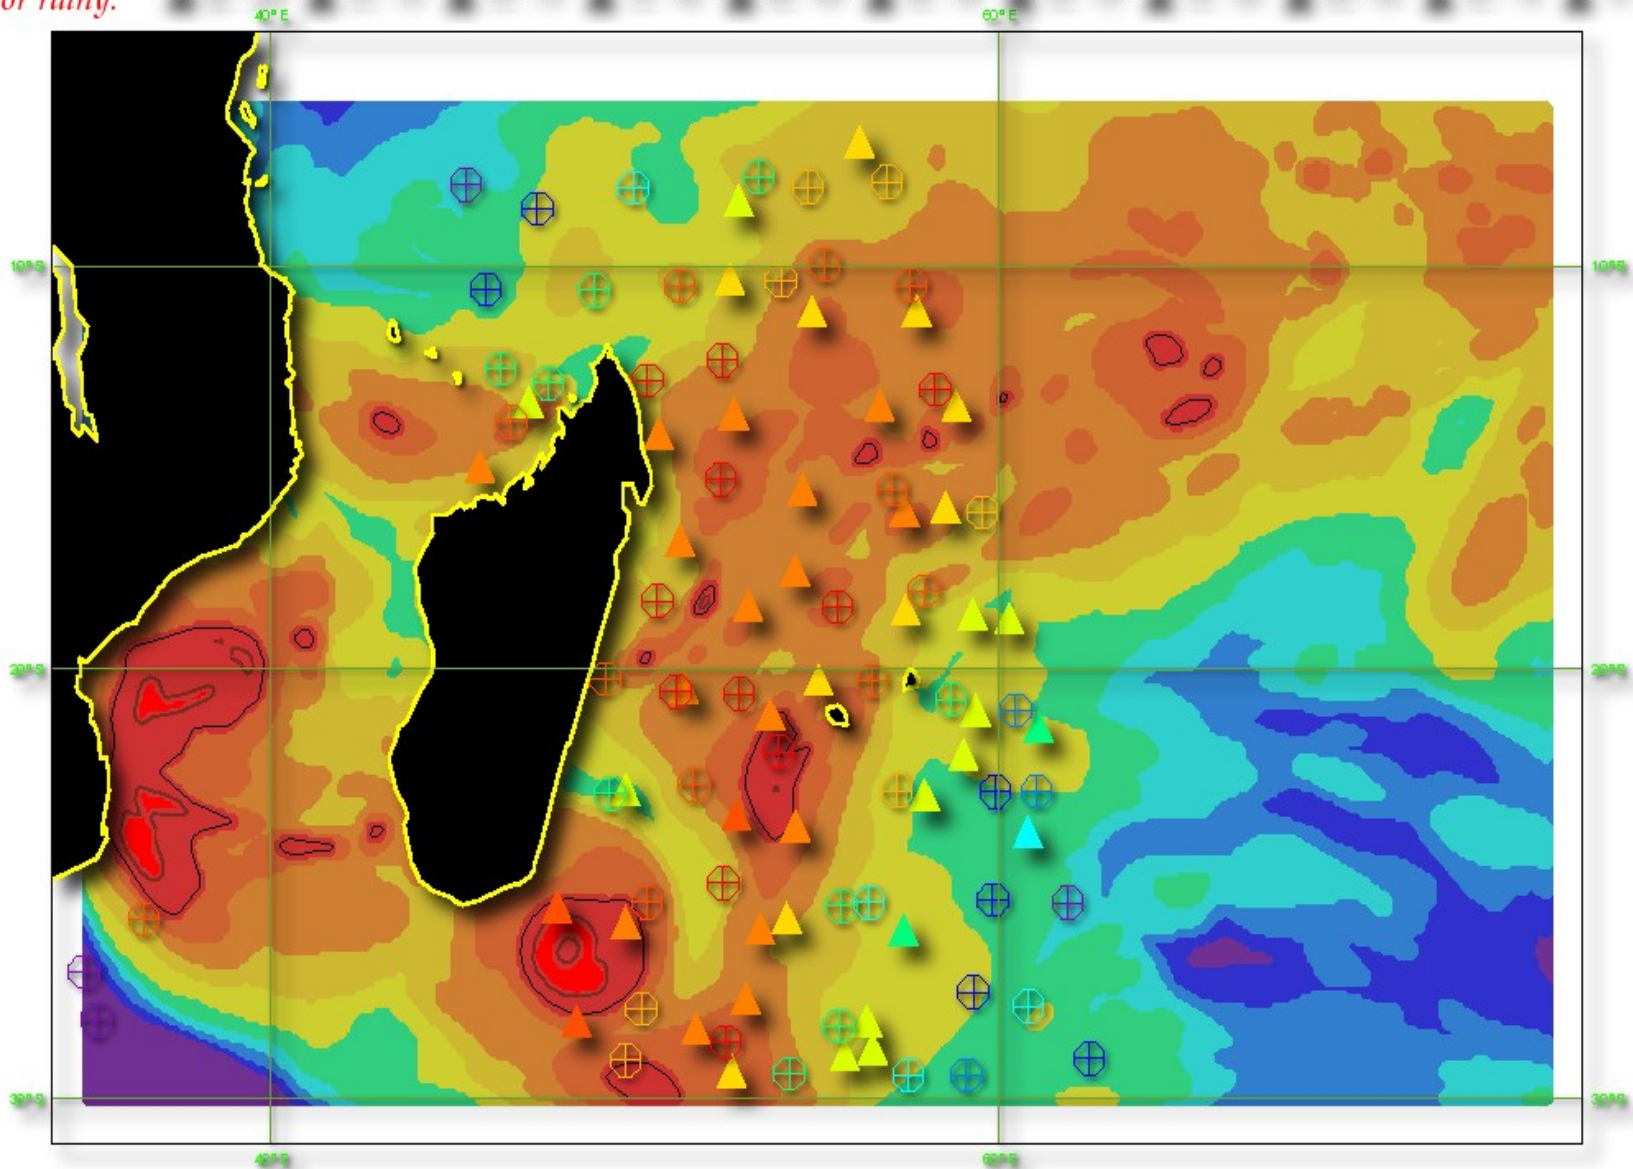

TB3 clearsky :

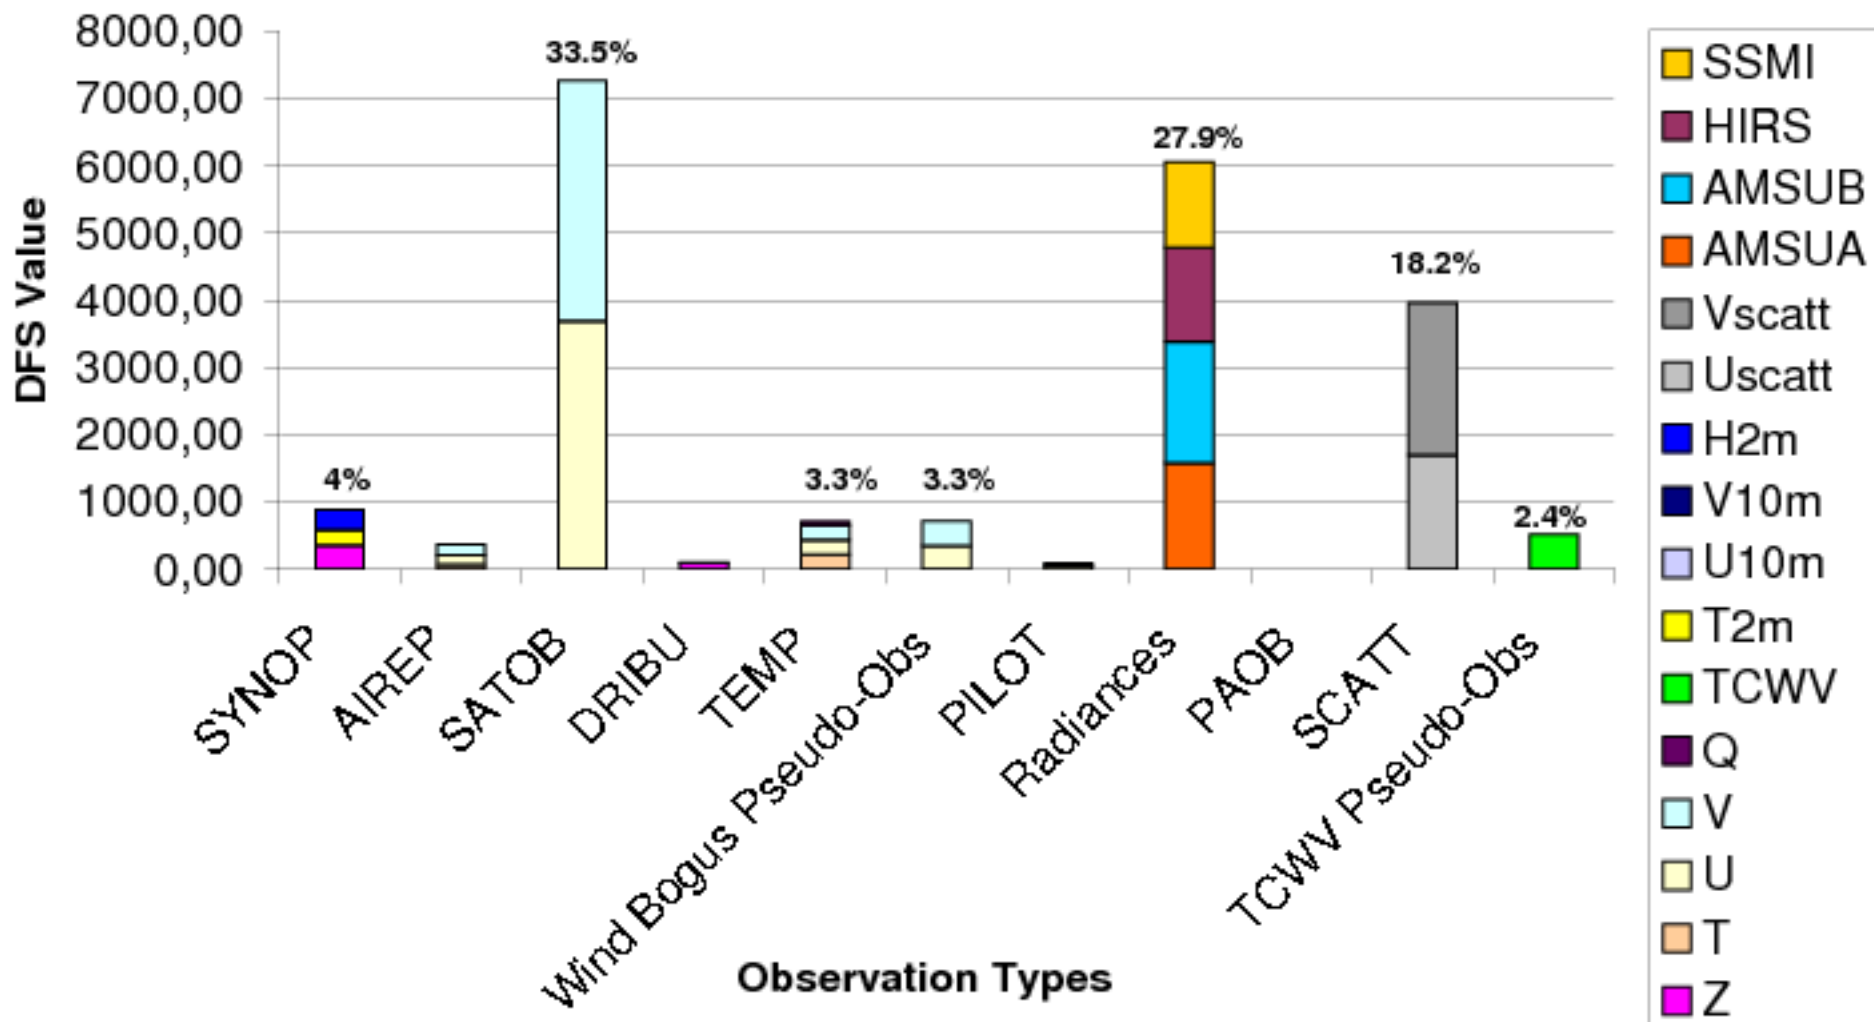

TCWV cloudy

or rainy:

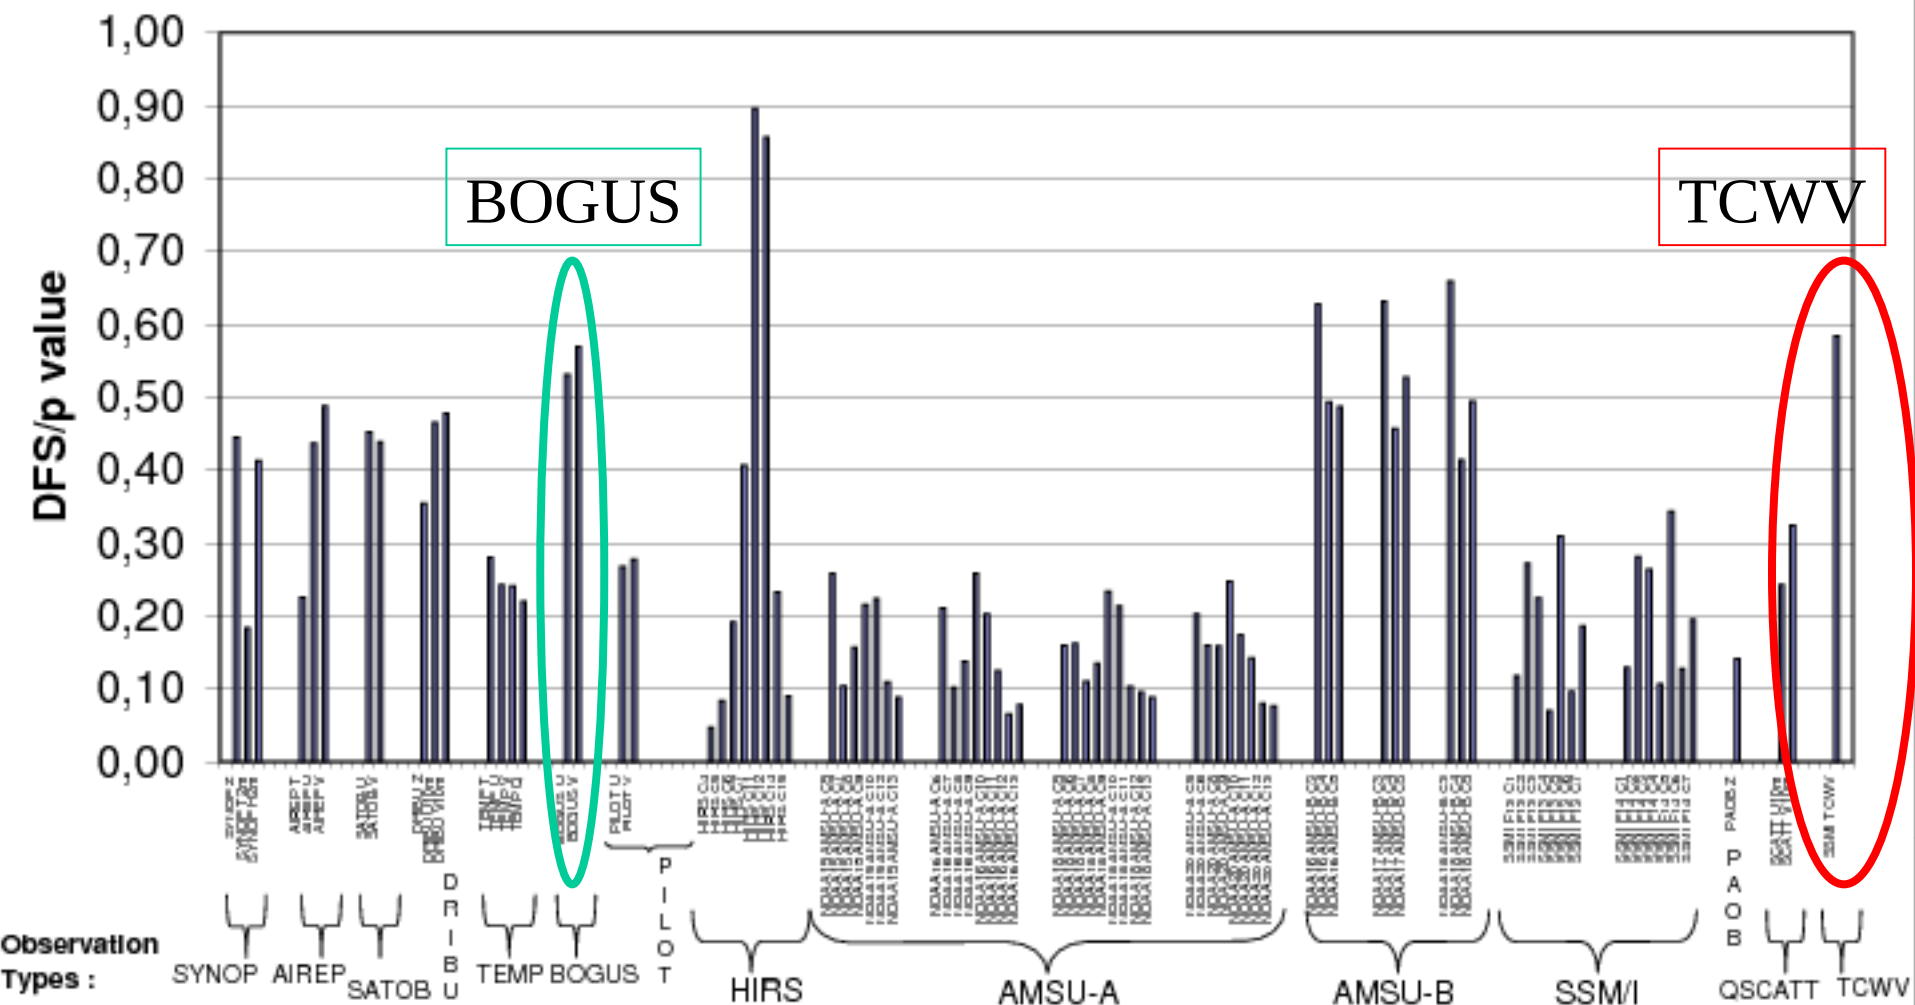

DFS over 16 analysis times (4 days)

OBSERVATIONAL IMPACTS ON THE 3DVar ANALYSES

DFS/p : information content of each obstype and individual measurement

IMPACT ON HUMIDITY FIELDS

5-WEEK STATISTICS IN TERMS OF TRACK ERROR

Between 2007/02/12 and 2007/03/17

Homogeneous statistics

Leadtime (h)

INDLALA: Intense TC, 88 death toll

Rain Rates
(mm/h)

Conclusion & Future work

- This technique works and is definitely beneficial for the model: TCWV data assimilation helps constrain the analysis in cloudy/rainy conditions and leads to more realistic TC features, and to a better depiction of tropospheric humidity content (not shown).
- Possible expansion of the method to other satellites and other basins is to be investigated
- Up to 100% more SSM/I data points are gained in previously unsampled areas
