# Asian Dust

Chinese desert distributions from 1960 to 1979 and desert plus desertification areas from 1980 to 1999. Adapted from Zhang et al. (2003).

# Backgrounds

---

## Visible (VIS):

- Effects of dust on blue and yellow bands are much different.
- Limitations over bright surface and daytime-only retrieval

## Infrared (IR):

- Dust detection over high-albedo surfaces and during nighttime is possible.
- Sensitive to water vapor and other gases

It is valuable to employ **improved IR measurements** with a sufficient spectral resolution to distinguish the IR radiative signature of mineral dust from others (e.g. Sokolik, 2002).

 **Hyperspectral sensors** (AIRS, IASI)

# Radiative transfer simulation procedures

---

**Surface properties**

$T_s, \epsilon_s$

**Atmospheric information**

$T_{\text{air}}(z), \text{WV}(z), \text{O}_3(z)$

**Asian dust properties**

AOT,  $Z_{\text{dust top}}, Z_{\text{dust base}}$ ,  
aerosol optical properties  
( $k_a, k_s, \omega, P(\Theta), b$ )

**RTM: RTTOV-9**  
(AOPs from OPAC)

**TB simulations**

# Aerosol optical properties: refractive index

Refractive index for mineral dust in OPAC

Optical properties of  
Asian dust

$k_a$ ,  $k_s$ ,  $\omega$ ,  $P(\Theta)$ ,  $b$

# Aerosol optical properties: size distribution

## Dust observations at Dunhuang

Location: 94.8 N, 40.1 E

Period: Oct. 1998 – Jan. 2007

Dust event threshold: AOT > 0.5

$\alpha < 0.3$

## Number size distribution

## Mineral dust modes in OPAC

- Nucleation mode
- Accumulation mode
- Coarse mode

# AIRS TB simulations for dust cases

## AIRS

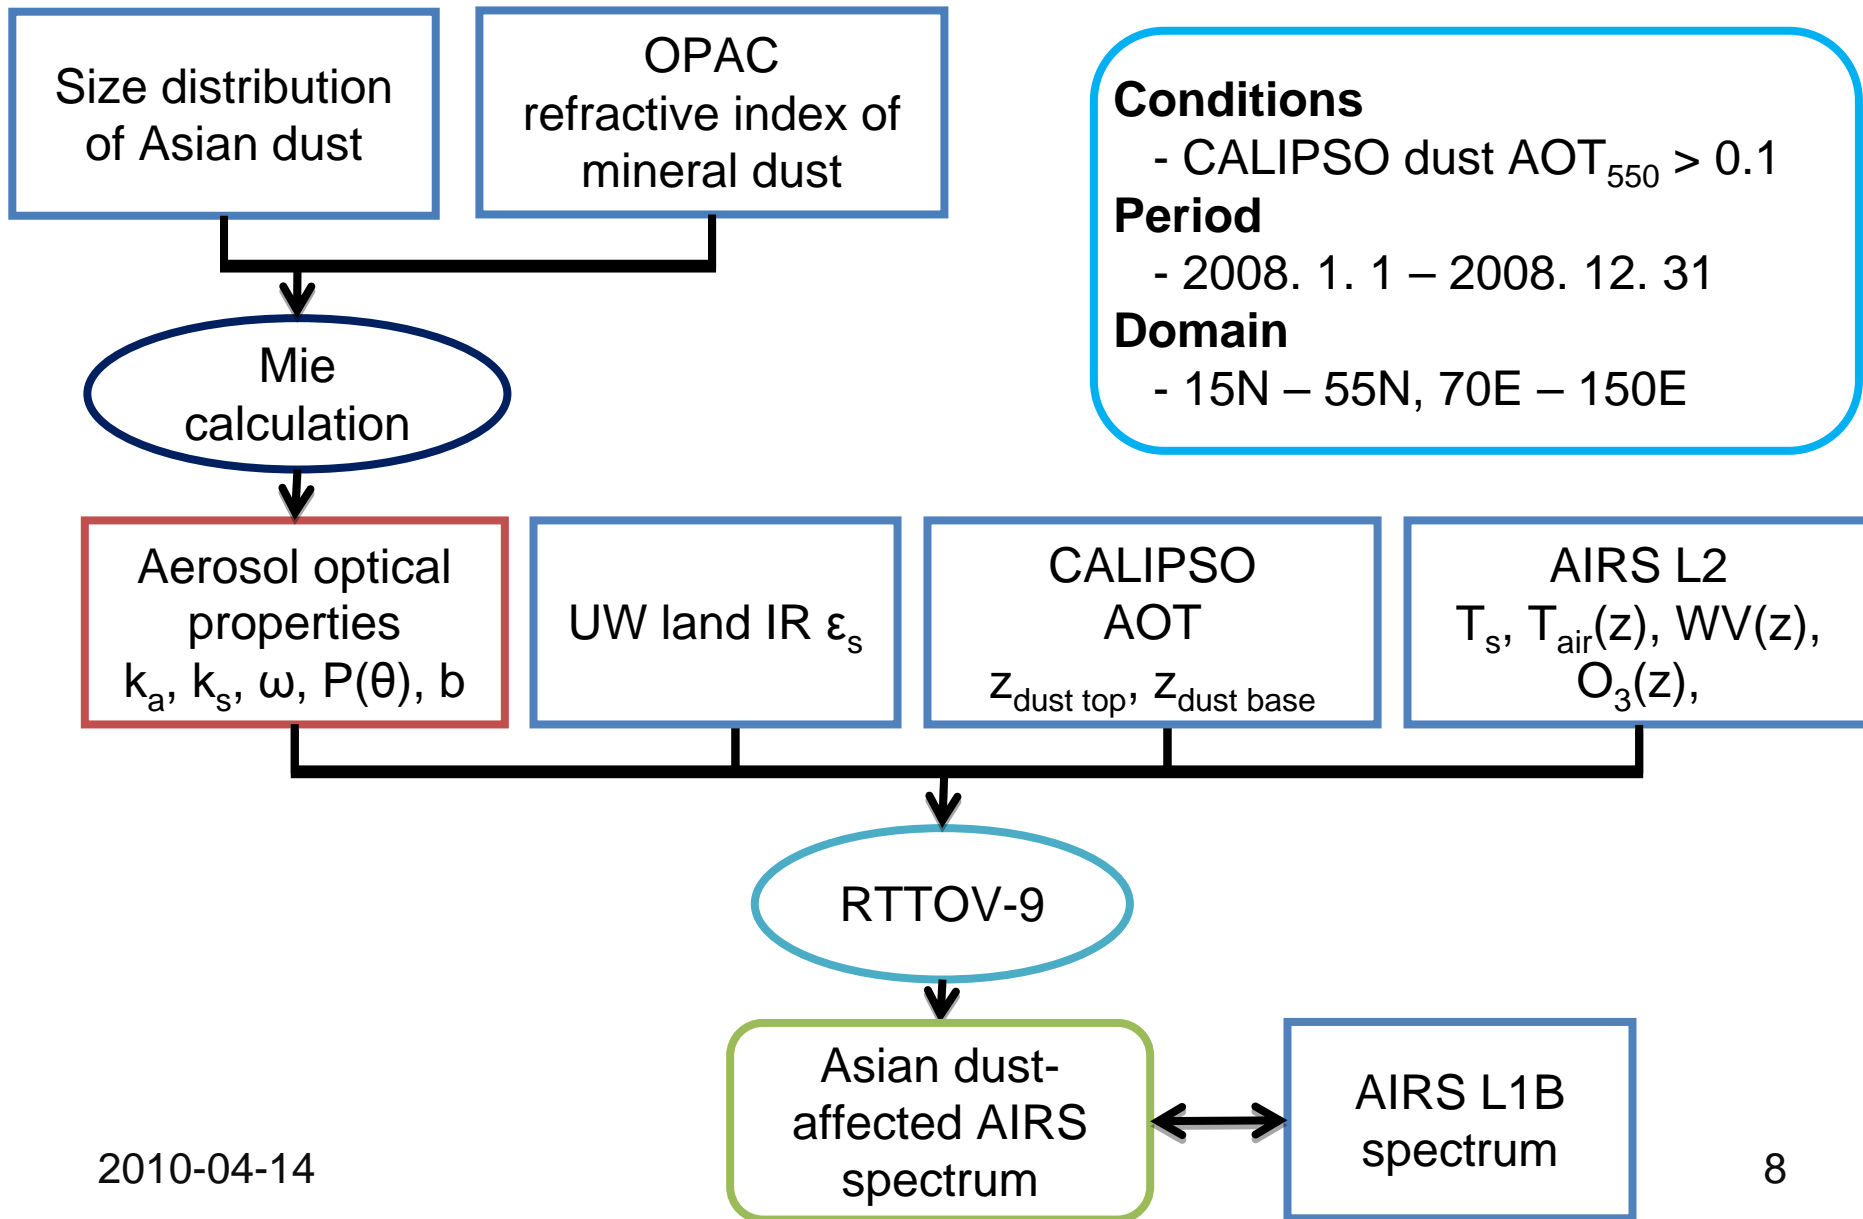

- Level 1B spectrum
- Level 2 support product:  
 $T_s$ ,  $T_{\text{air}}(z)$ ,  $WV(z)$ , and  $O_3(z)$

## CALIPSO

- AOT,  $z_{\text{dust top}}$ ,  $z_{\text{dust base}}$ , Feature Classification Flags

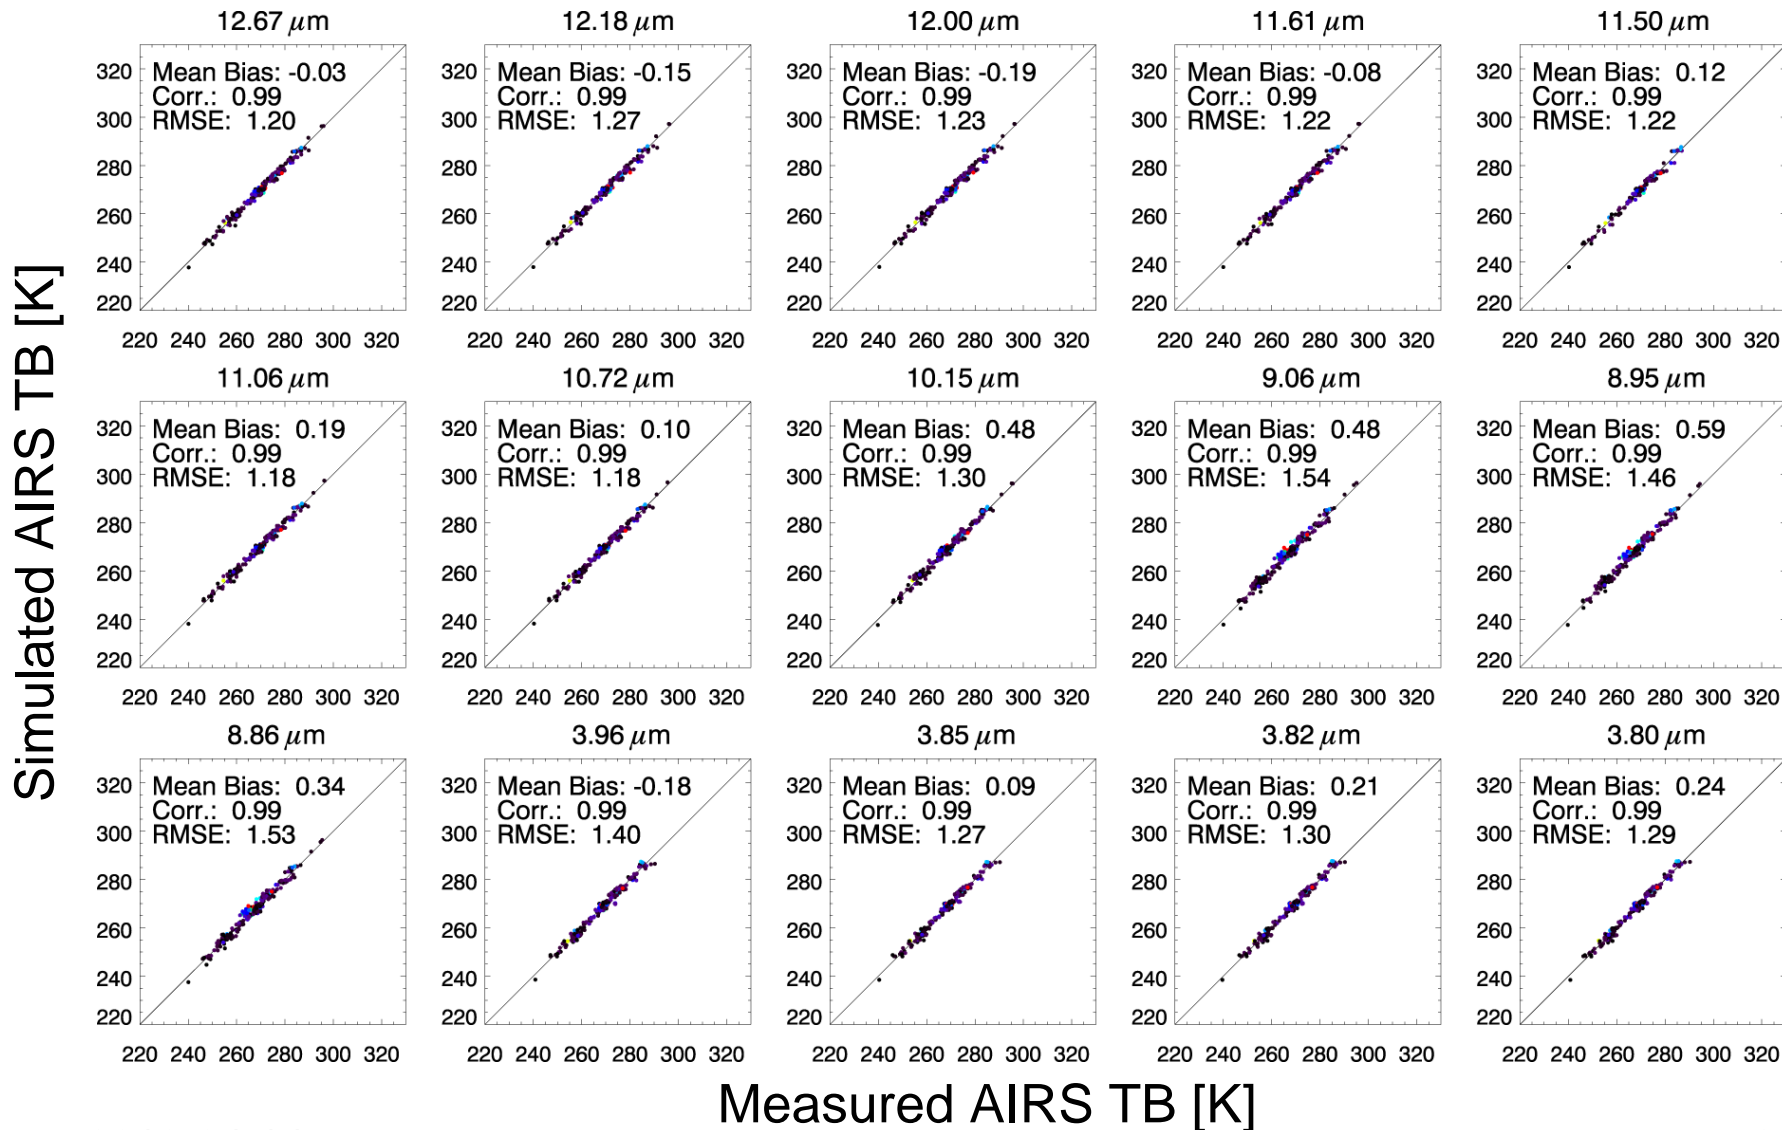

# Simulation of dust affected AIRS spectrum

# Simulated AIRS TB vs. measured AIRS TB

# Simulated TB – measured AIRS TB vs. AOT

# Mean simulated TB - measured AIRS TB

$AOT_{550} < 0.5$

$AOT_{550} \geq 0.5$

# Conclusions

- For weak dust cases, simulation errors can be occurred due to the inexact surface information.
- Results show the improved performance over spectral ranges of 10.2 – 12.7 μm and 3.8 – 4.1 μm when the dust effect was added.
- However, over spectral range of 8.8 – 9.3 μm, TB difference between simulation and measurement was increased.
- Overestimation in the range of 8.8 – 9.3 μm is probably because this spectral region is very sensitive to dust composition (Sokolik, 2002).
- It is expected that the results can be incorporated for developing dust retrieval algorithm from hyperspectral images such as AIRS and IASI.
