Outline

- Assimilation of rain observations
- Assimilation of cloud observations
- Summary

Assimilation of IR cloudy radiances

- Work on rain:
 - Initiated with rain retrievals
 - NL rainy 1D-Var provides TWVC then passed on to 4D-Var
- Cloudy 1D-Var
 - No usable IR cloud retrieval
 - 1D-Var provides $q(P)$
- No error estimation from NL 1D-Var (bias, std., corr.)
- Direct 4D-Var assimilation of Tbs?
 - Test idea with Meteosat and AIRS

Accuracy of H

- 30 November 2002
- Cloud-affected AIRS channels (McNally and Watts 2003)
- RTTOVCLD(FG) vs. OBS

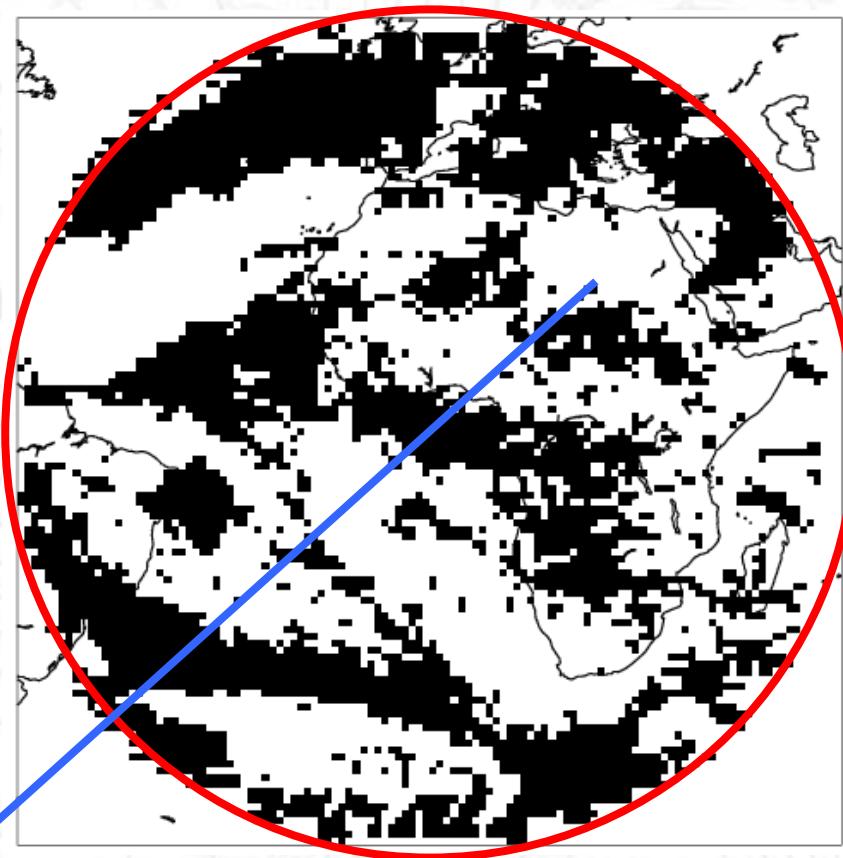

Linearity of H : method

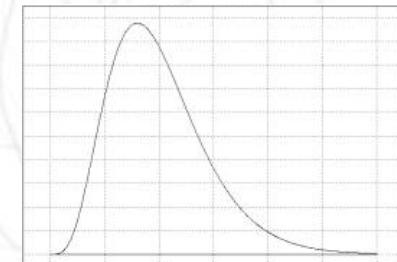

PDF of correlations between
 $H.\mathbf{dx}$ and $H[\mathbf{x}+\mathbf{dx}] - H[\mathbf{x}]$
Hemispheric data

- $\mathbf{x} = T, q$ profile
- H = cloud scheme
+ RTTOVCLD
- \mathbf{dx} = perturbation from B

30 November 2002
12 UTC
Meteosat WV cloud mask

Correlation (x,y)

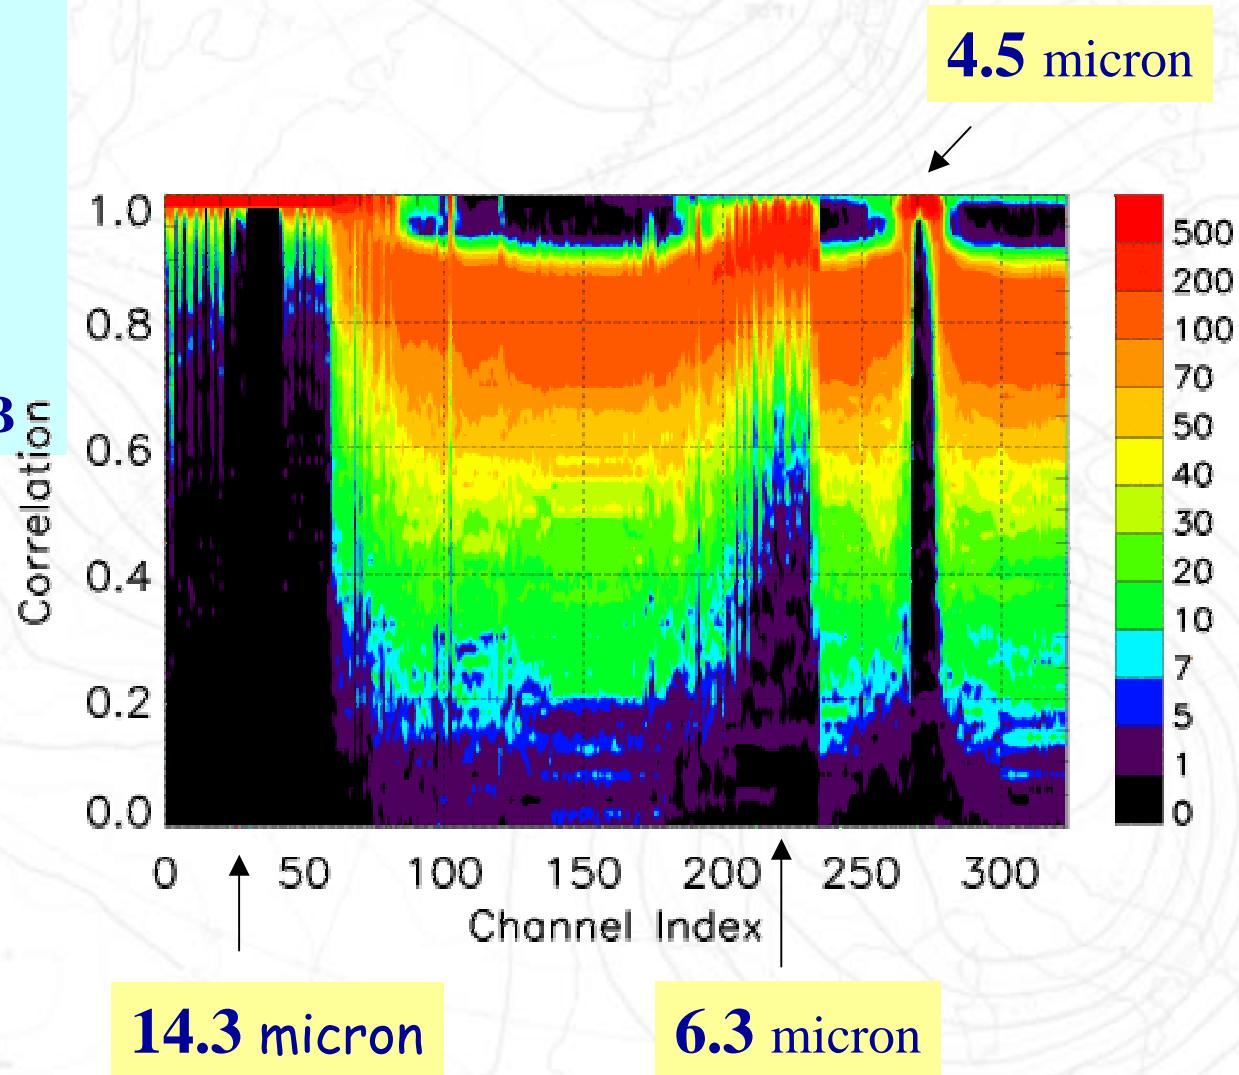

Linearity of H : results

PDF of correlations between
 $H \cdot dx$ and $H[x+dx] - H[x]$
Hemispheric data

- $x = T, q$ profile
- $H = \text{cloud scheme}$
+ RTTOVCLD
- $dx = \text{perturbation from } B$

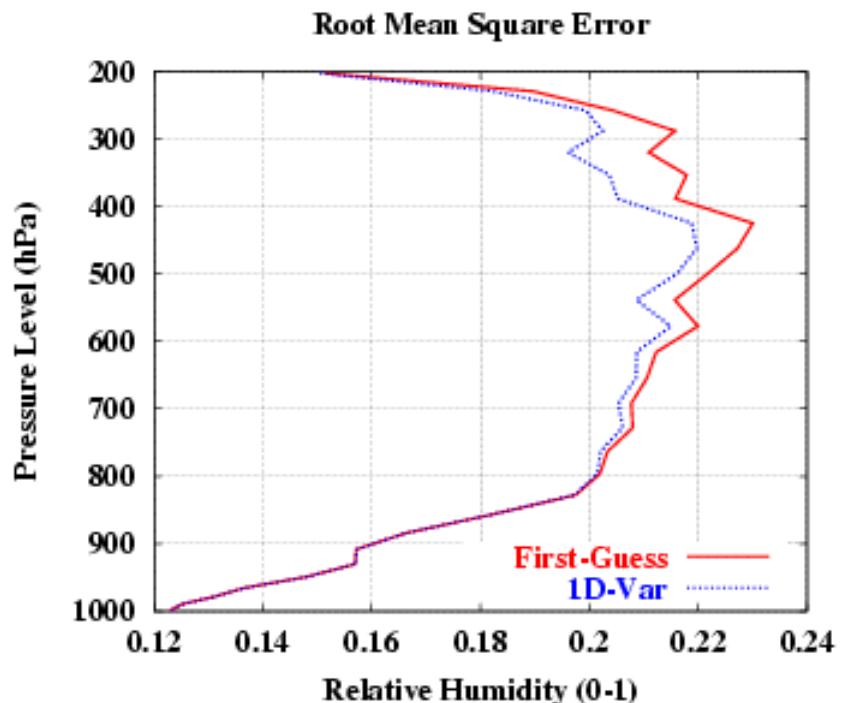

Cloudy AIRS and 1D-Var

- Linear 1D-Var retrievals
 - ✓ observations = 35 upper tropospheric AIRS channels
 - ✓ performed only if clouds are detected in more than 13 channels

Validation:

1D-Var vs
European radiosondes
Nov 2002 and Feb 2003

- If $T < 243K$ use Vaisala RS90 only
- ~ 250 matches in upper troposphere
- ~ 2300 matches in lower troposphere

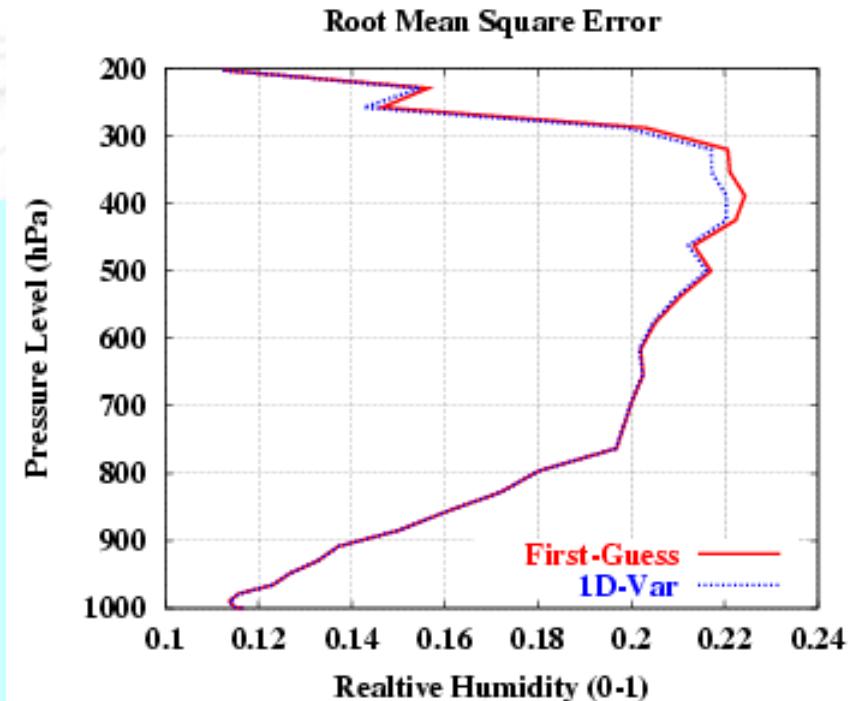

Cloudy Meteosat and 1D-Var

- Linear 1D-Var retrievals
 - ✓ observations = cloudy Meteosat WV

Validation:

1D-Var vs
European radiosondes
Nov 2002 and Feb 2003

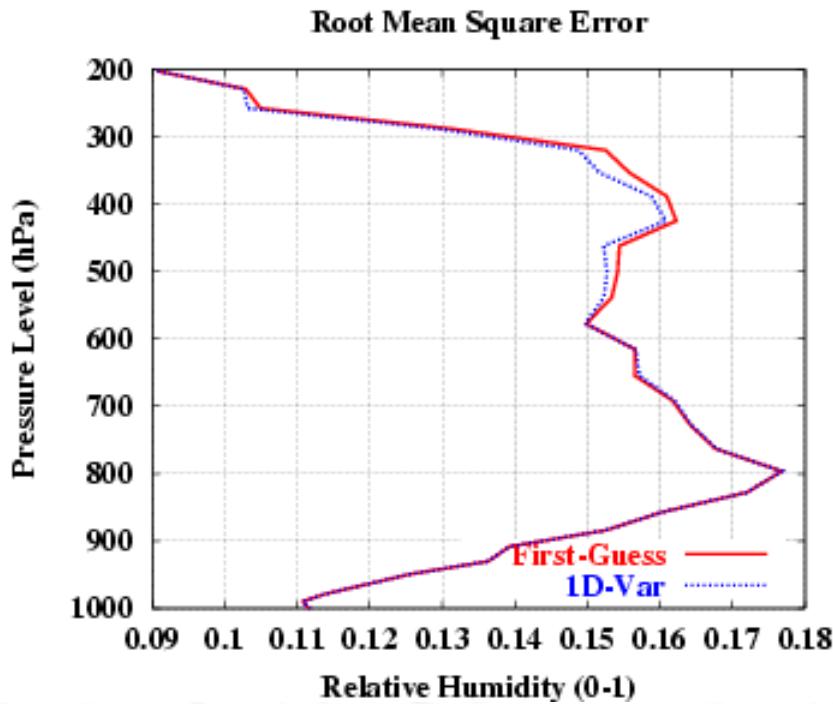

- If $T < 243K$ use Vaisala RS90 only
- ~ 250 matches in upper troposphere
- ~ 1500 matches in lower troposphere

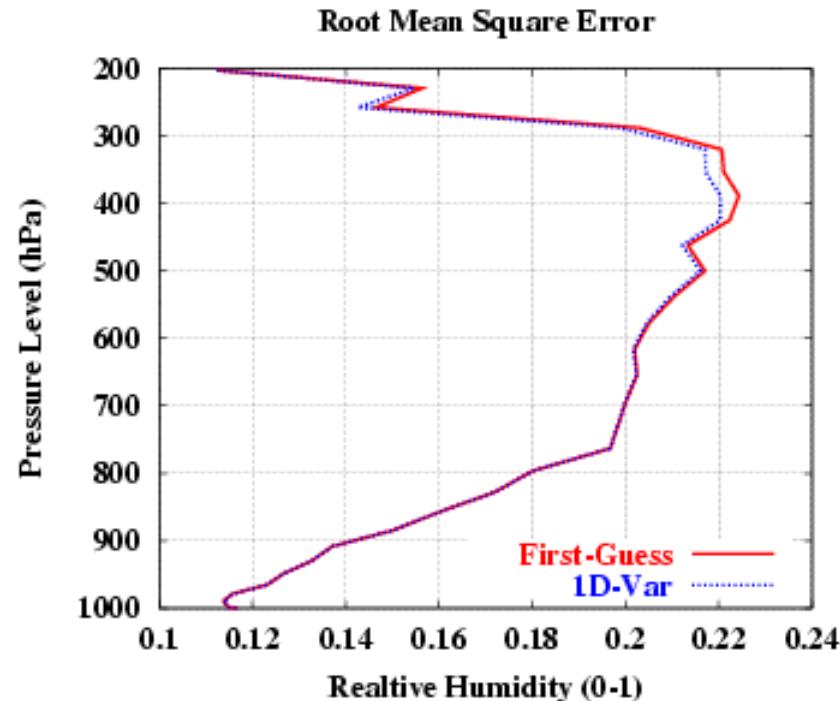

Cloudy Meteosat and 1D-Var

Clear quadrants

Cloudy quadrants

~ 250 matches in UT
~ 1500 matches in LT

~ 200 matches in UT
~ 1400 matches in LT

Summary

- 1D-Var+4D-Var approach developed for MW
 - Better forecast of tropical cyclones
 - Impact in Extra-tropics to be examined
- On-going direct 4D-Var
 - IR: 4.5, 6.3 and 14.3 micron
 - 6.3 micron from geostationary satellites
 - MW: 22 GHz
 - Small increments
 - Better handling of errors in 4D-Var analysis (Bayesian)
- RTTOV extended
 - RTTOVCLD: Multilayer cloudiness, absorption, IR+MW
 - RTTOVSCATT: MW scattering
 - extensions in standard v8
