

# Effect of Air Mass Predictor Choice on the AIRS Bias Correction

Brett A. Harris<sup>1</sup>,

Andrew Collard<sup>2</sup>, Roger Saunders<sup>2</sup>, James Cameron<sup>2</sup>

Based on the Harris and Kelly bias correction scheme used at ECMWF and the Bureau of Meteorology, a bias correction code was set up to apply to a given set of channel from the AIRS instrument on the AQUA satellite. Using a choice of bias predictors, scan only and air-mass predictors based on background fields, various combinations of predictors were applied to a large subset of AIRS channels in order to determine the optimal set of predictors for the subset.

# Dataset used for April 2003

	90S-60S	60S-30S	30S-30N	30N-60N	60N-90N	Global
Total	3935	50468	158164	20222	2073	234862
Thinned	3935	5873	5811	9157	2073	26849

# March using small channel subset

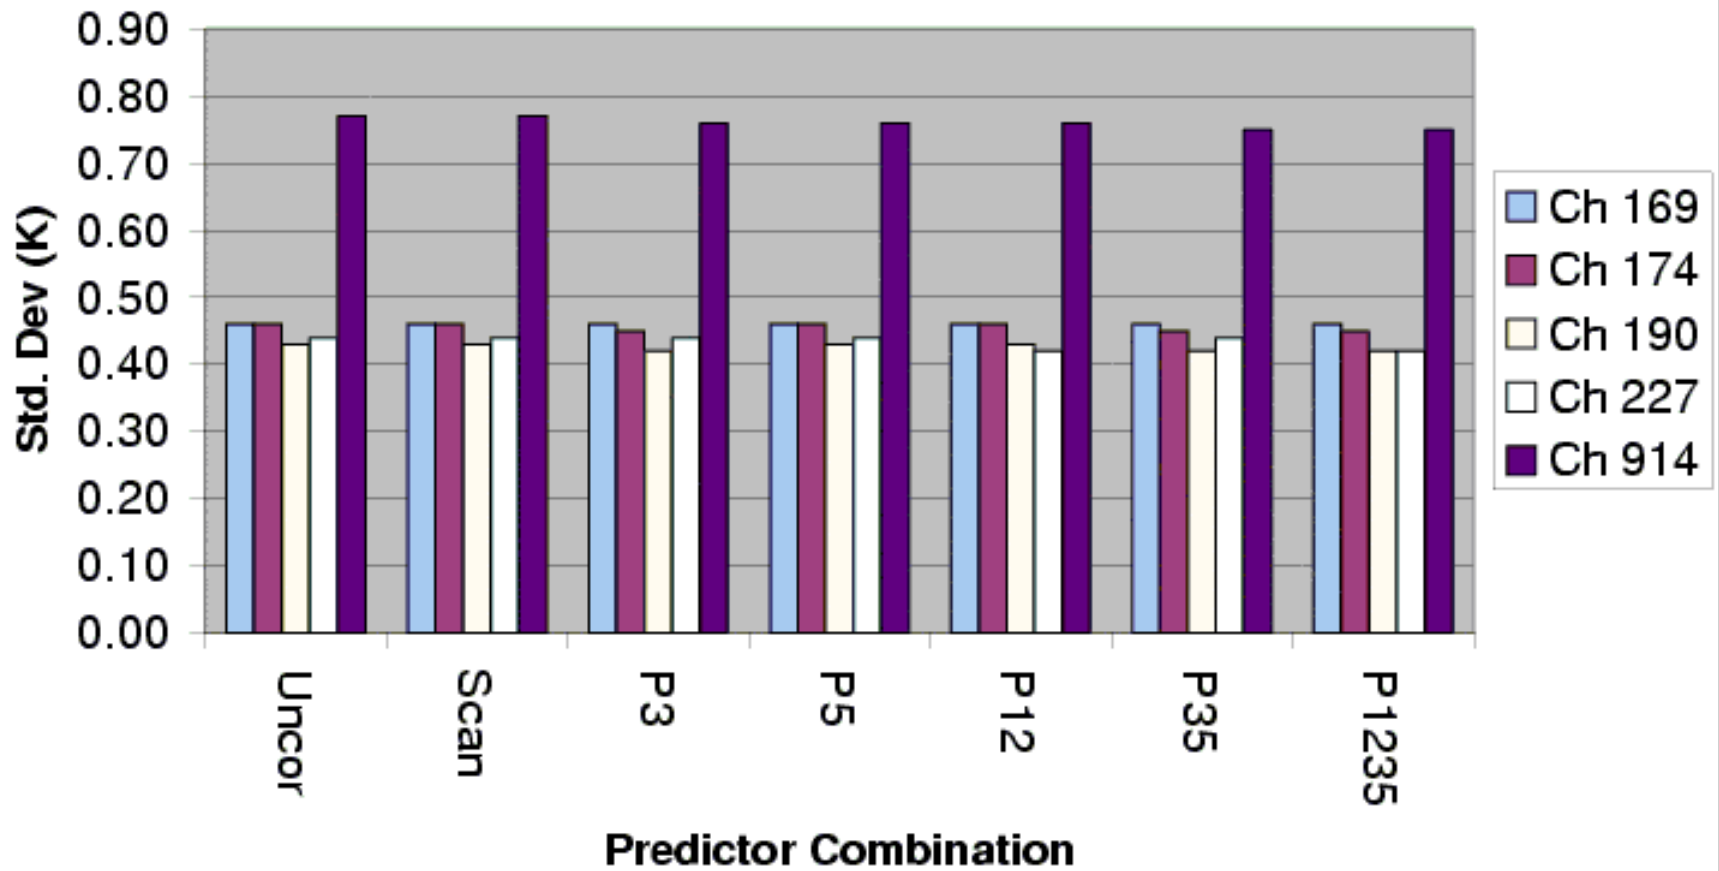

<b>Index</b>	73	77	85	100	140
<b>Channel</b>	169	174	190	227	914
<b>Wavenumber</b>	698.276	699.276	704.162	714.782	965.842

# Air Mass Bias Predictors

---

- 1 850 – 300 Hpa
  - 2 200 – 50 Hpa
  - 3 Skin Temperature
  - 4 Total Column Water Vapour (not used)
  - 5 Background Radiance
-

## Standard Deviation Global

Uncor Ch 169

Scan Ch 169

P12 Ch169

P3 Ch 169

P5 Ch169

P35 Ch 160

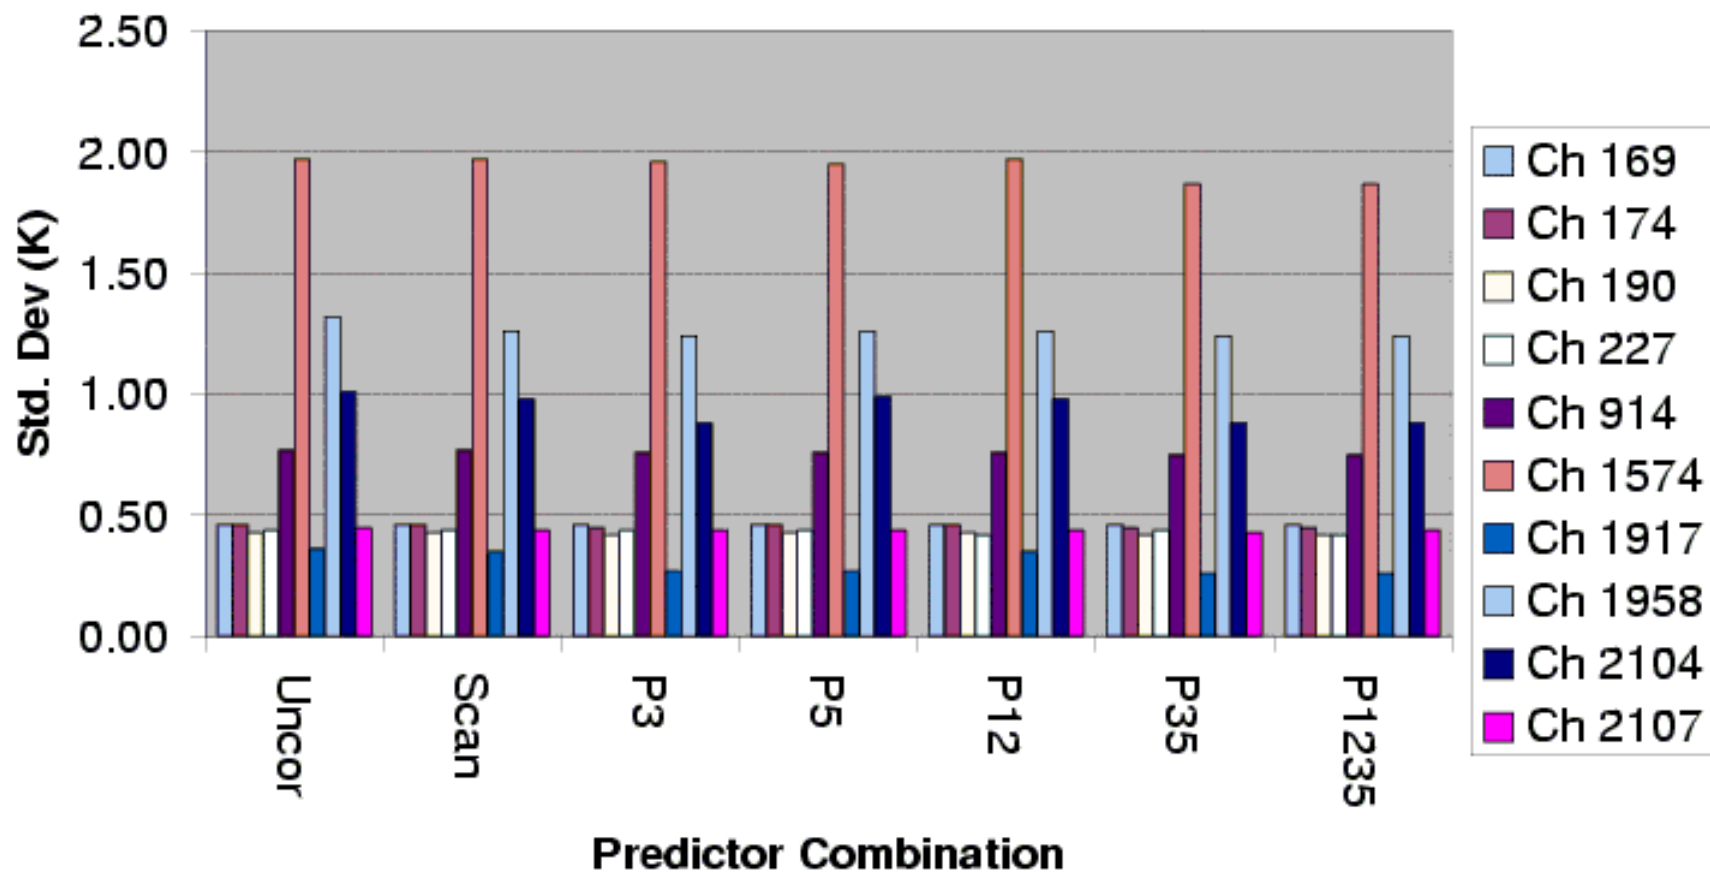

# Further Five Channels for March

<b>Index</b>	203	253	266	279	281
<b>Channel</b>	1874	1817	1958	2104	2107
<b>Wavenumber</b>	1397.708	2330.566	2270.009	2384.283	2387.208

## Standard Deviation Global

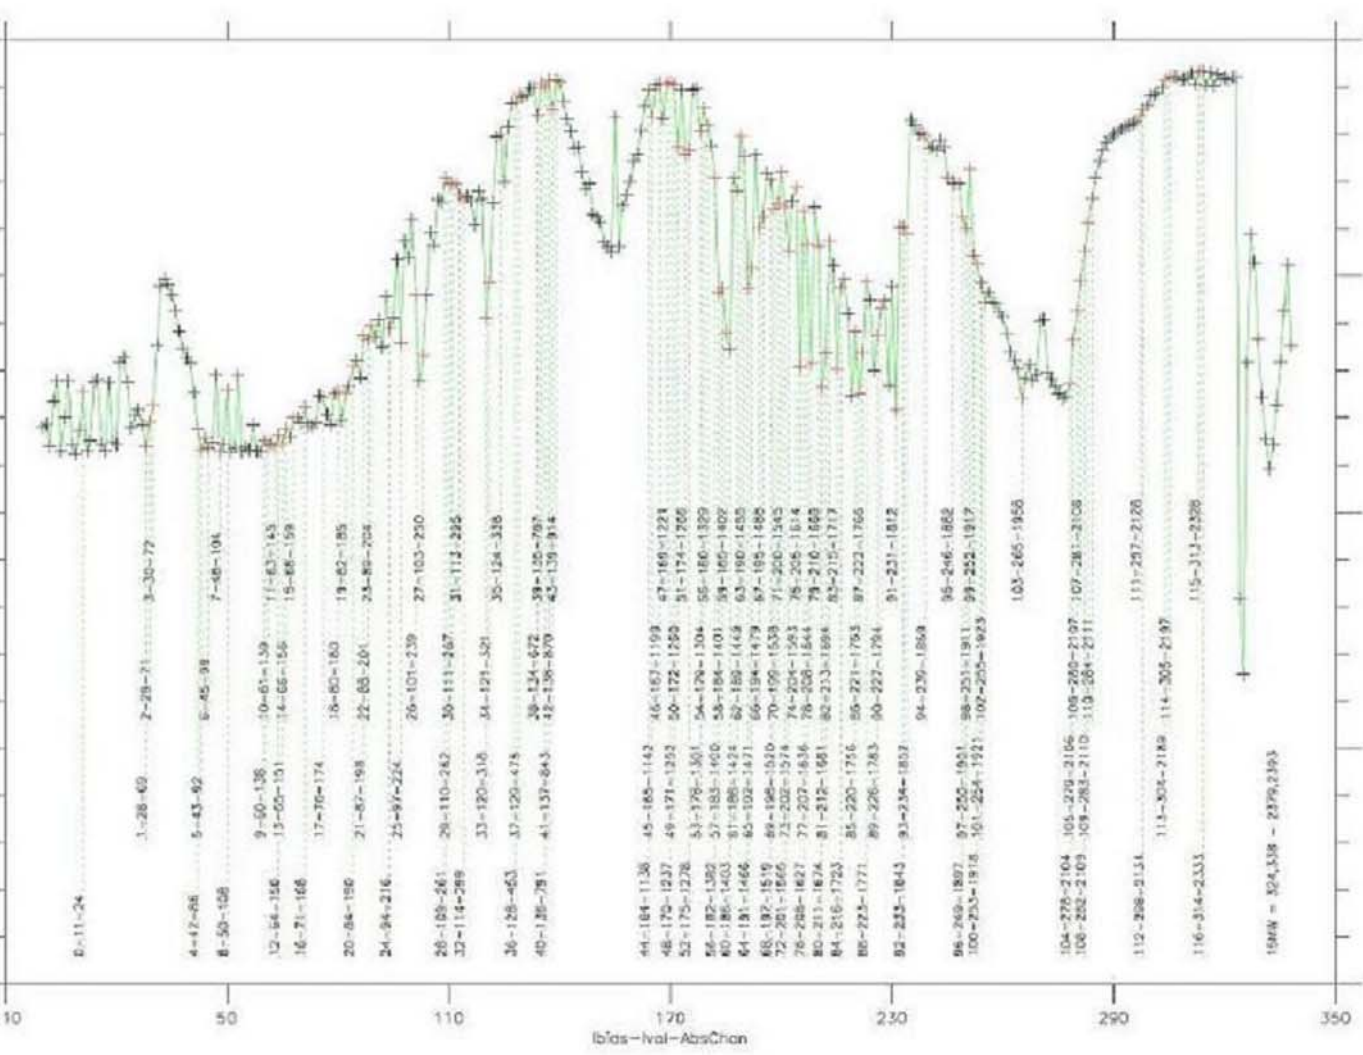

# Preliminary Conclusions From March Dataset

---

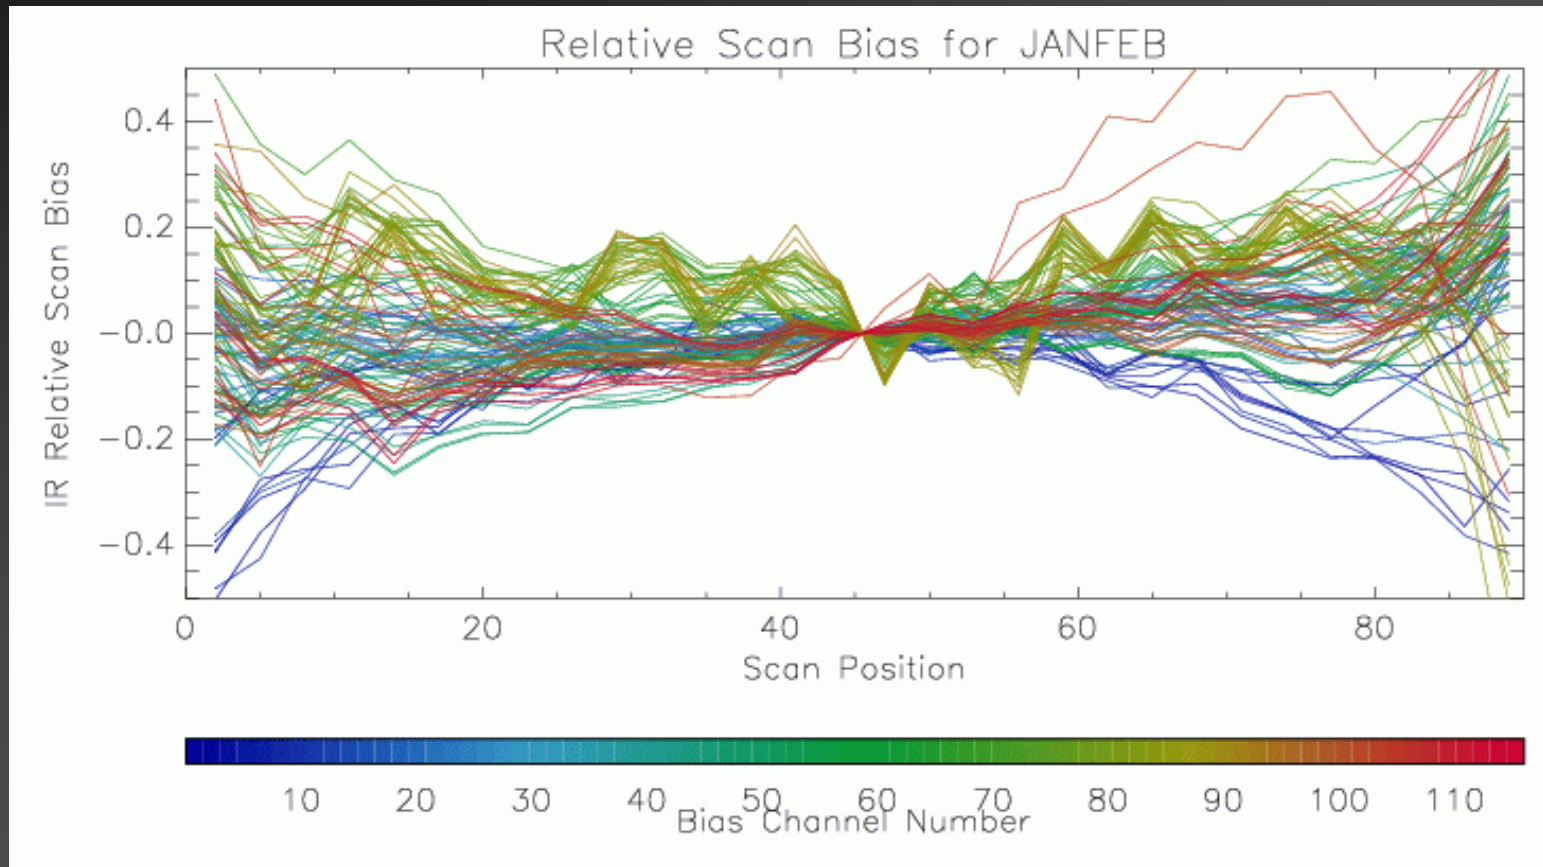

- Scan Correction alone unsatisfactory
  - P5 and P12 inadequate
  - P35 and P1235 gives best results
-

# Dataset used for Jan/Feb 2003

	90S-60S	60S-30S	30S-30N	30N-60N	60N-90N	Global
Total	4189	48994	133838	15940	624	203585
Thinned	4189	5951	5144	6867	624	22775

# Scan Bias For Jan/Feb

# Corrected Bias for 117 Channels

# Standard Deviation

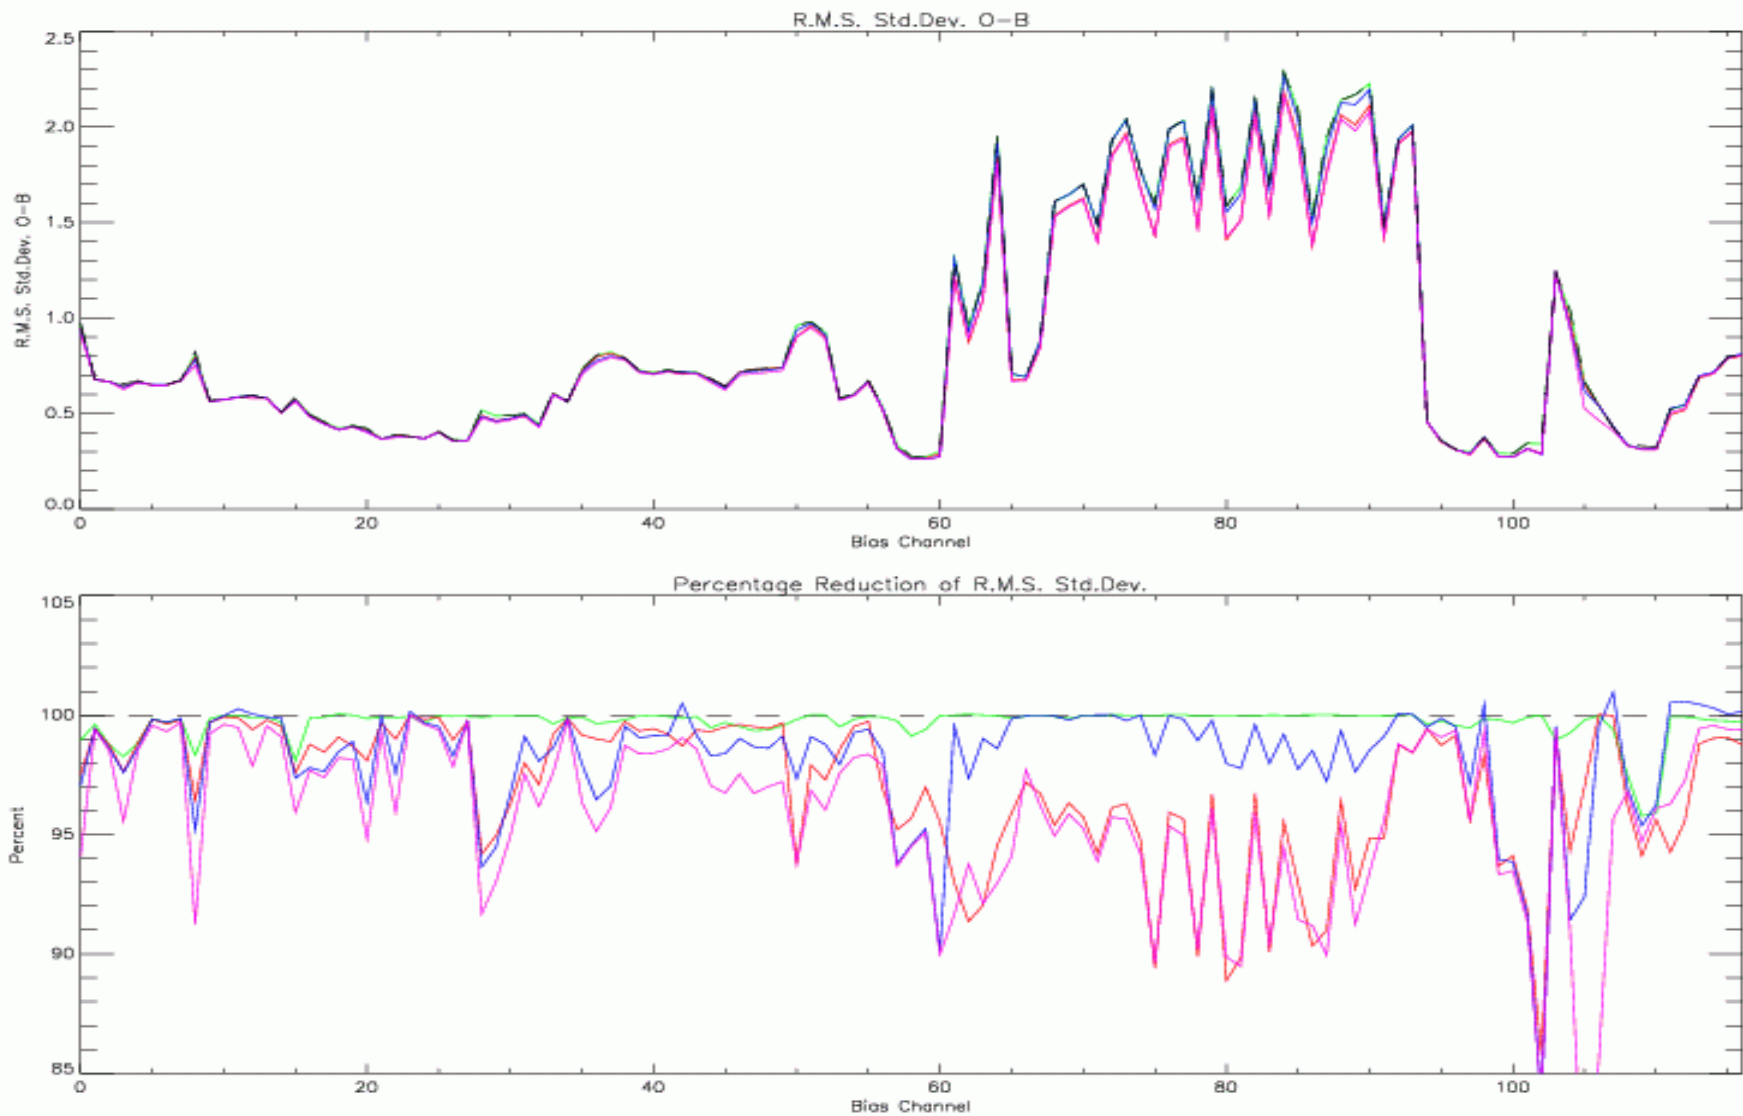

# RMS Mean

# RMS Standard Deviation

# Conclusions

---

- Scan Correction Inadequate
  - P35 Reduced Std Dev but not Mean
  - P12 Reduces Mean but not Std Dev
  - P1235 Best Overall
-
