

NOAA/NESDIS Plan for AIRS, CrIS and IASI: Program and Science

Mitch Goldberg, Chris Barnet, Walter Wolf, Lihang Zhou, Tom King, and Murty Divakarla

Satellite Meteorology and Climatology Division

NESDIS Office of Research and Applications

May 30, 2005 ITSC-14

AIRS & MODIS PRODUCTS ARE DISTRIBUTED THROUGH THREE MAIN CHANNELS

- **NWP Centers**
- **NCEP**
- **Navy**
- **ECMWF**
- **UK Met Office**
- **more**

- **Science Community**
- **Public**

- **Universities**
- **Local Weather Stations**
- **Brazil (INPE)**
- **China**
- **DoD**
- **Other International**

Risk Reduction Benefits

- Early demonstration of operational processing of high spectral resolution infrared sounder data prior to CrIS, IASI and GOES-R
- Early opportunity for forecast centers to learn how to assimilate advanced IR data

AIRS Update

- ORA has implemented the AIRS/AMSU processing system – quasi-operational
- Processing system is based on the retrieval methodologies developed by the AIRS Science Team
- Science Algorithms developed by NASA, NOAA, UW, MIT, UMBC - truly a collaborative effort
- Science improvements are continuing

Science Improvements

- Adding MODIS to improve cloud clearing
- Adding trace gas retrieval algorithms to derive CO₂, CO, and CH₄
- Improving surface emissivity/bidirectional reflectance (non-ocean)
- Improving data compression algorithms

AMSU is a critical component of AIRS

- provides retrievals in overcast conditions
- drives cloud clearing

AIRS acquires 2,916,000 spectra = 35 GByte/day

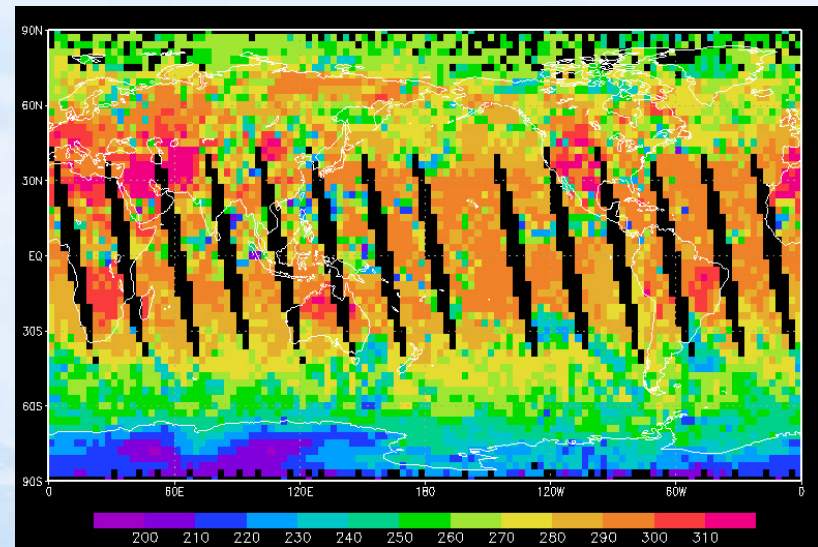

AIRS/AMSU Products for a ≈ 50 km footprint (varies w/ view angle), 324,000 footprints/day

- Cloud Cleared Radiance
- Temperature
- Moisture
- Ozone
- Land/Sea Surface Temperature
- Surface Spectral Emissivity
- Surface Reflectivity
- Cloud Top Pressure
- Cloud Liquid Water (AMSU product)
- Cloud Fraction (per 15 km footprint).
- Carbon Monoxide
- Carbon Dioxide
- Methane
- Cirrus Cloud Optical Depth and Particle Size, Aerosols

NOAA-Unique AIRS Products

- Tailored radiance datasets for NWP data assimilation, including PC scores
- Products into BUFR format
- Use of MODIS to improve AIRS cloud-cleared radiances.
- Noise-filtered radiances based on eigenvector decomposition (reconstructed radiances)
- Thinned datasets for scientific studies, including reprocessing for climate.

AIRS Radiance Products from NOAA

- a) center/warmest of 3 x 3 from every AMSU fov, ~300 channels. + AMSU (16 mbytes per orbit)
- b) 200 principal component scores using same thinning as a)
- c) Every 2nd 3 x 3 AIRS fovs (~300 channels) plus all AMSU
- d) cloud cleared a) and b)
- e) Reconstructed Radiances
- f) Full resolution AMSU
- g) MODIS at AIRS resolution

AIRS Level 2 Products from NOAA

a) Full resolution level 2 products – temperature, moisture and ozone, cloud amount, cloud height, surface emissivity, surface temperature, including carbon products

b) MODIS cloud products @ AIRS resolution

NOAA Operational Processing

- AIRS/AMSU/MODIS integrated processing system is currently being modified to generate the same family of products from EUMETSAT IASI/AMSU/AVHRR and from NPOESS CrIS/ATMS/VIIRS
- Same Science (e.g. same transmittance model, same cloud detection/clearing, etc) and Software will process AIRS, IASI and CrIS
- Prelaunch Simulated Products -- repeating AIRS approach

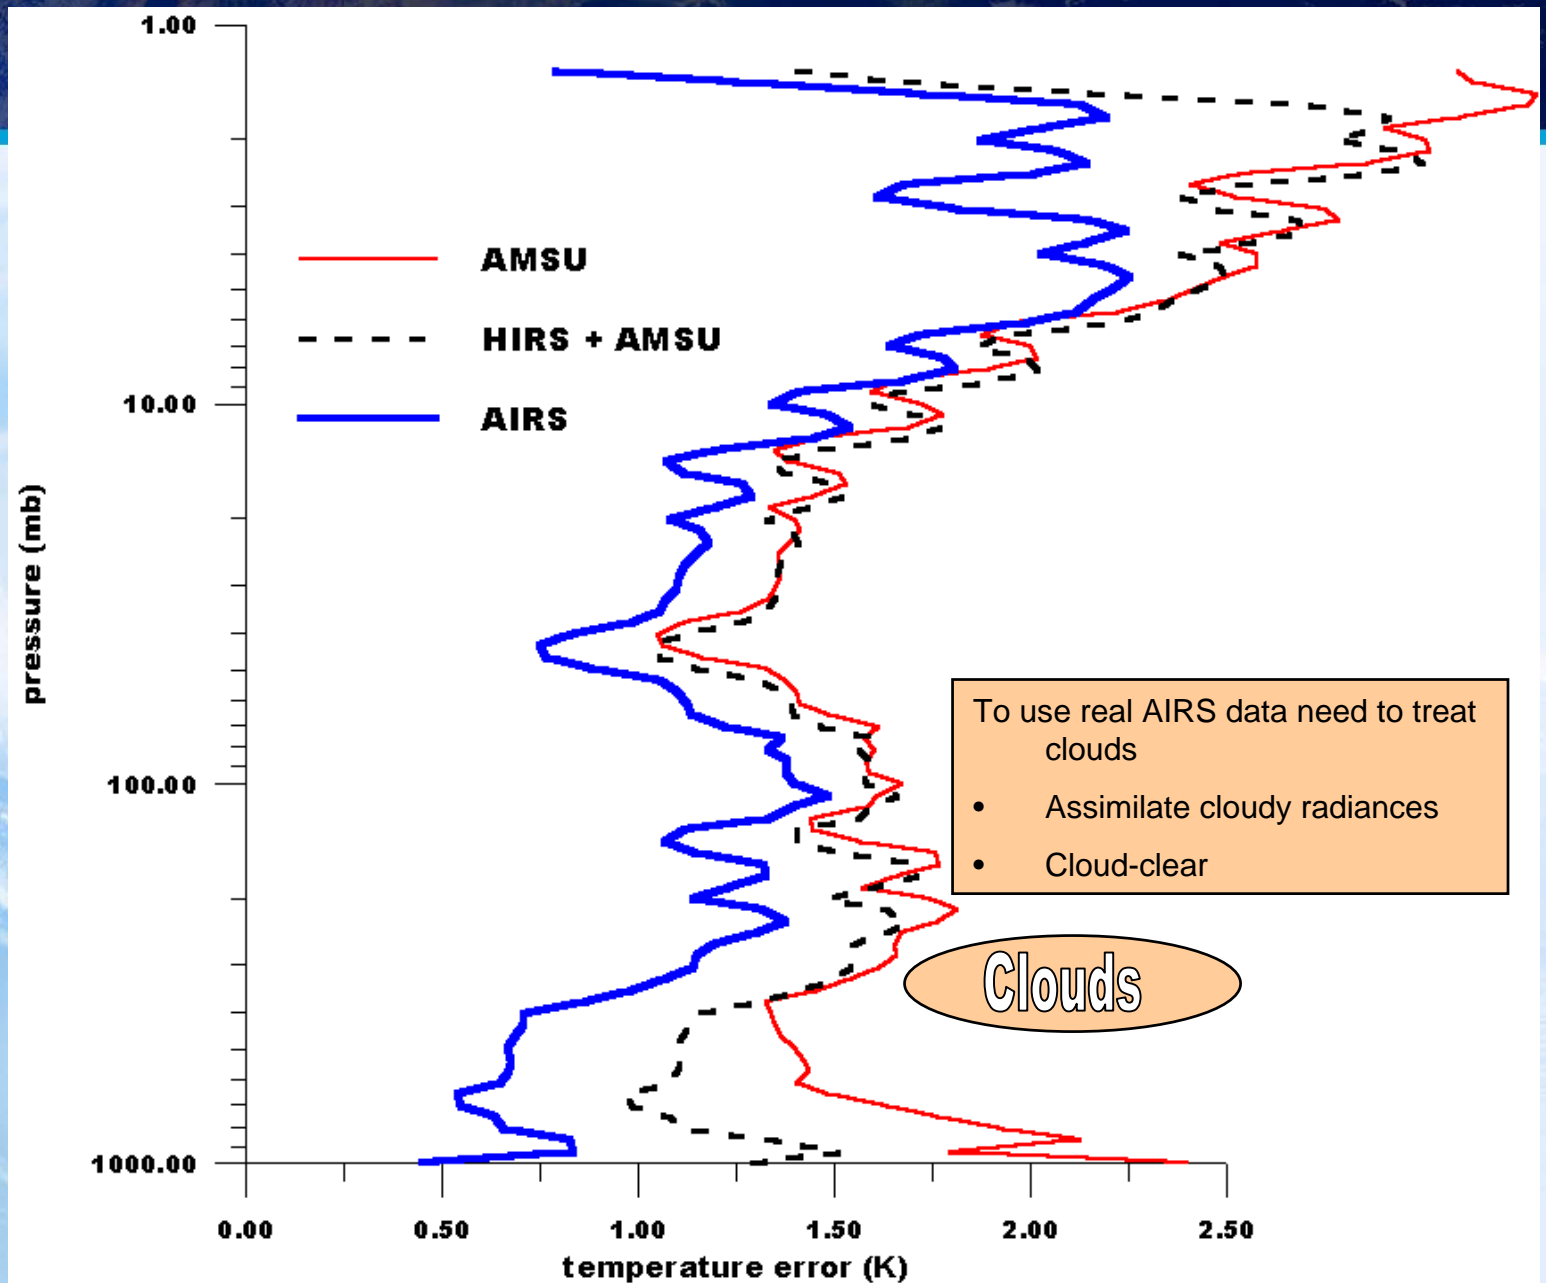

Science and Applications

- Cloud Clearing using MODIS
- Carbon Products
- Validating NWP Products

Temperature errors as a function of sounder instrumentation

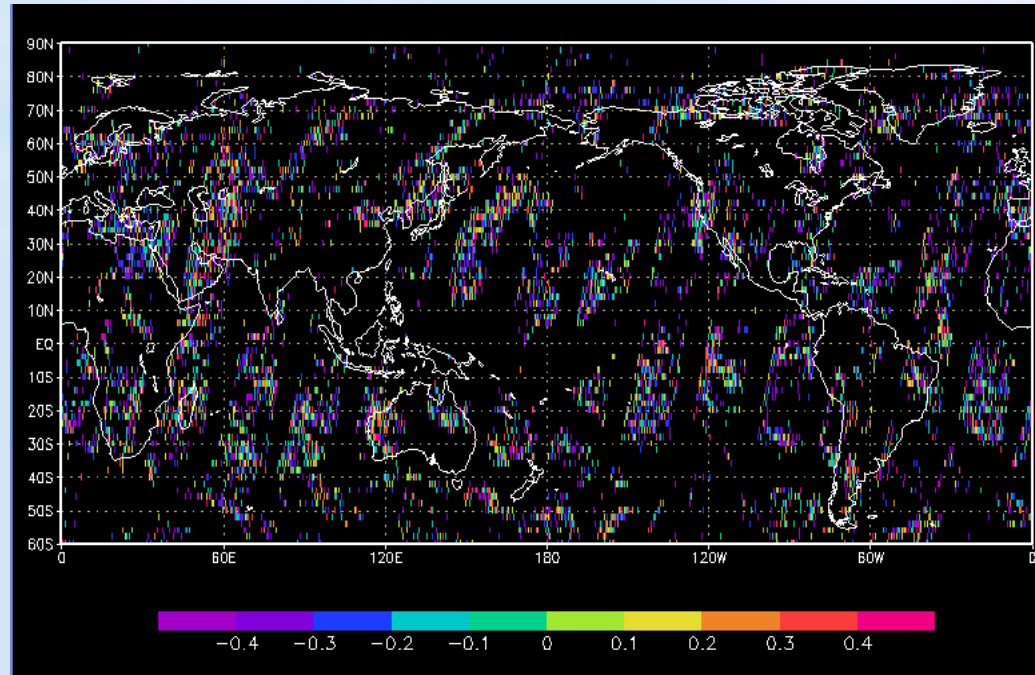

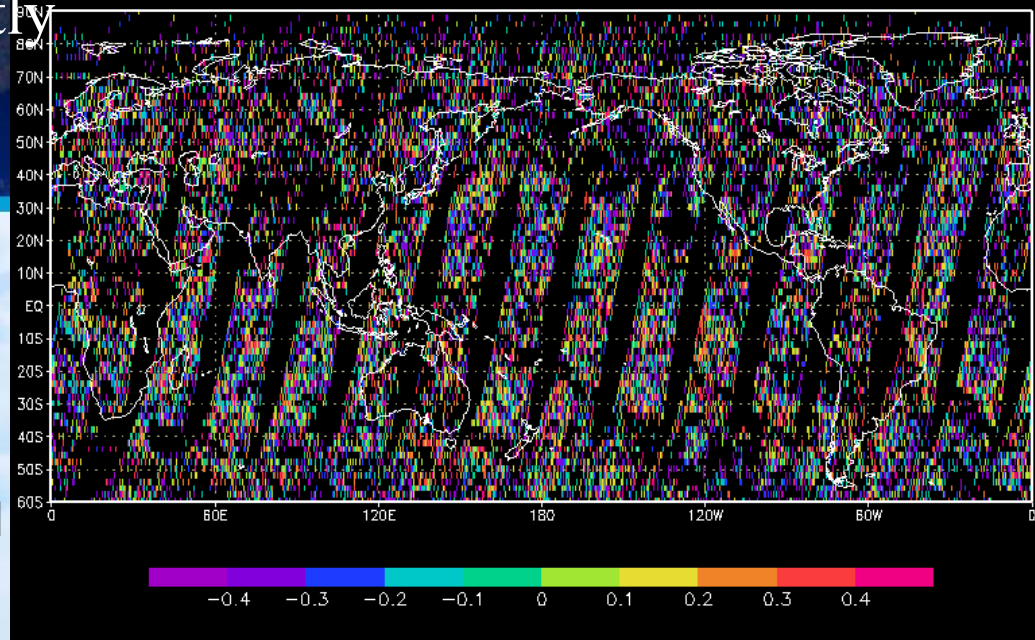

Cloud clearing significantly improves data coverage

735.69 cm⁻¹ (peak ~ 700 mb)
ALL diff < +/- 0.5 K

**Cloud-cleared minus clear simulated
brightness temperatures (ECMWF)**

**700 MB – Lower to
Mid Troposphere**

**Observed minus clear simulated
brightness temperatures (ECMWF)**

965 cm-1 (window)

ALL diff < +/- 0.5 K

Cloud-cleared minus ECMWF

NEAR SURFACE

Relatively few observation
with no cloud clearing

Raw minus ECMWF

WE have tools to integrate MODIS with AIRS for Improved cloud clearing, left figure is cloud-cleared AIRS convolved to MODIS, and right figure is MODIS clear averaged to AIRS fov

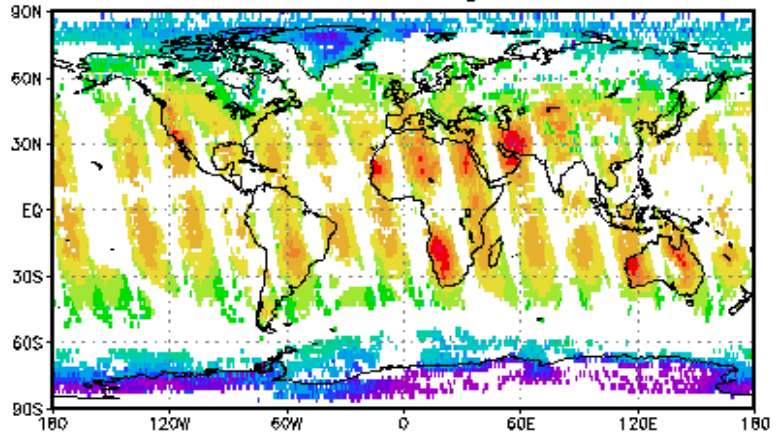

Cloud-Cleared AIRS convolved to MODIS

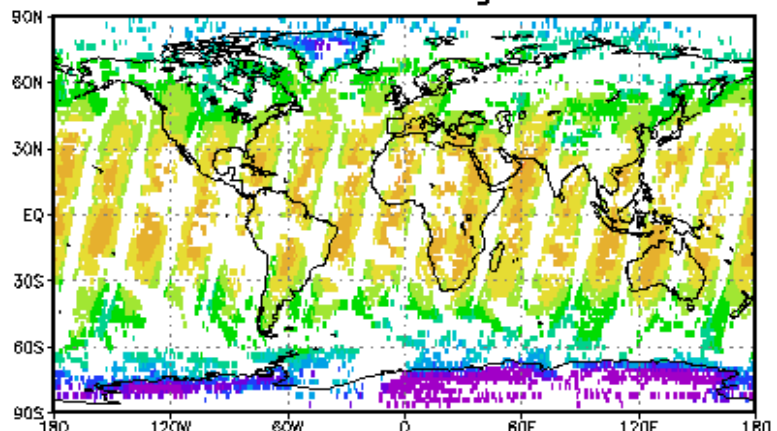

Ascending

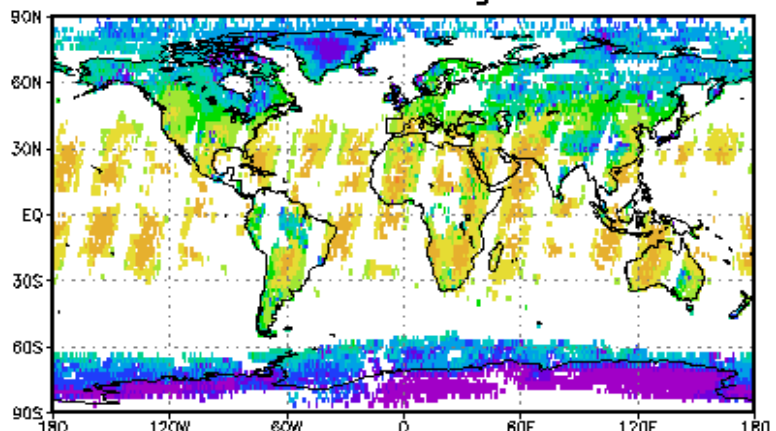

MODIS Ch-33, Clear Ascending

Descending

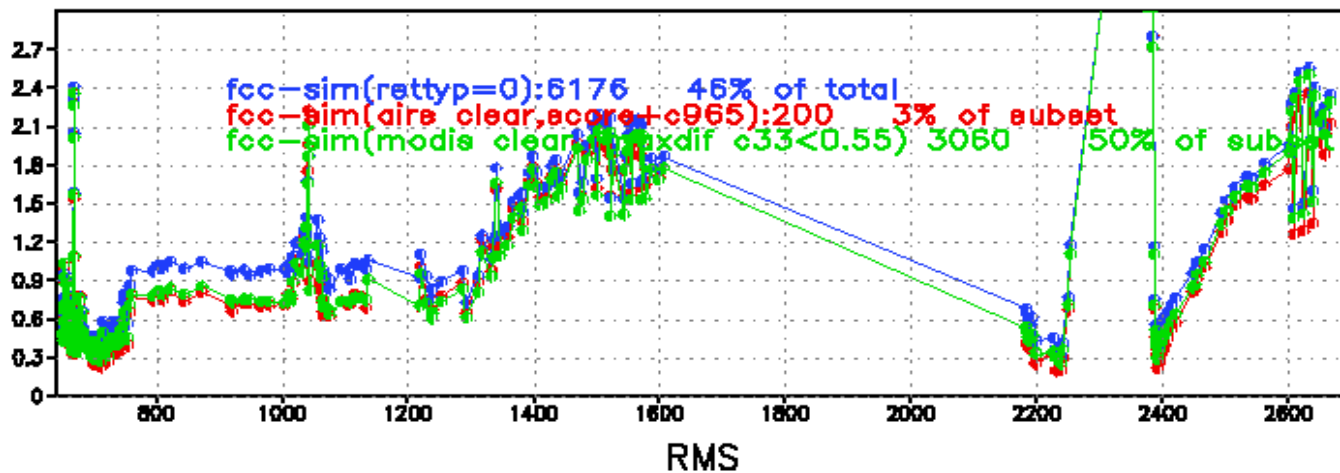

Descending

Currently using MODIS to quality control AIRS Cloud-Cleared Radiances

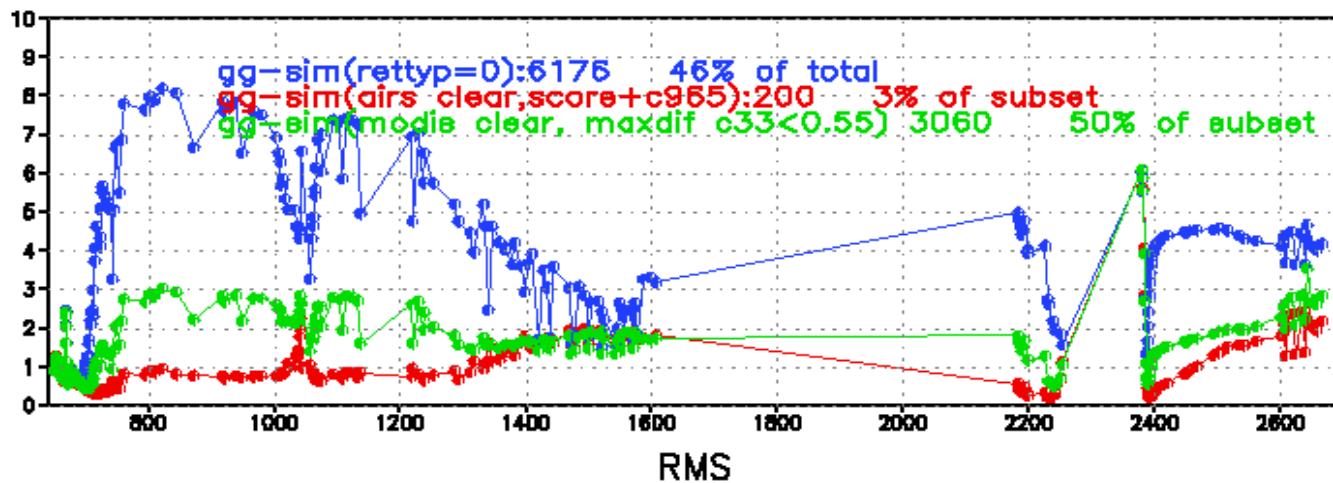

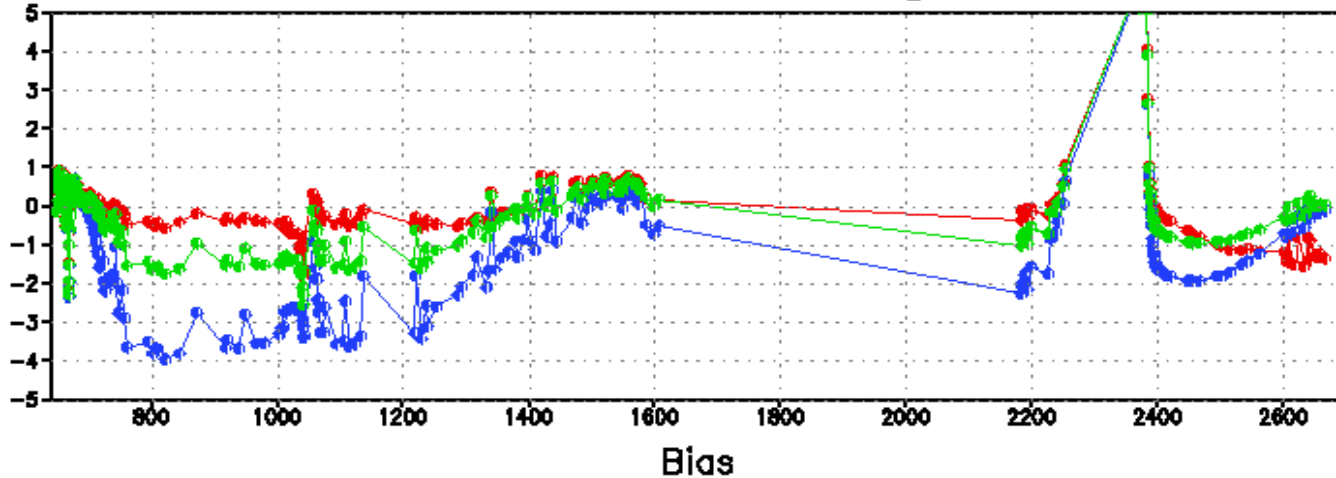

OCT,10, 2004, Ocean, Ascending, -40 to 40

Cloud-clear minus clear simulated (ECMWF)

Consequence of not cloud-clearing

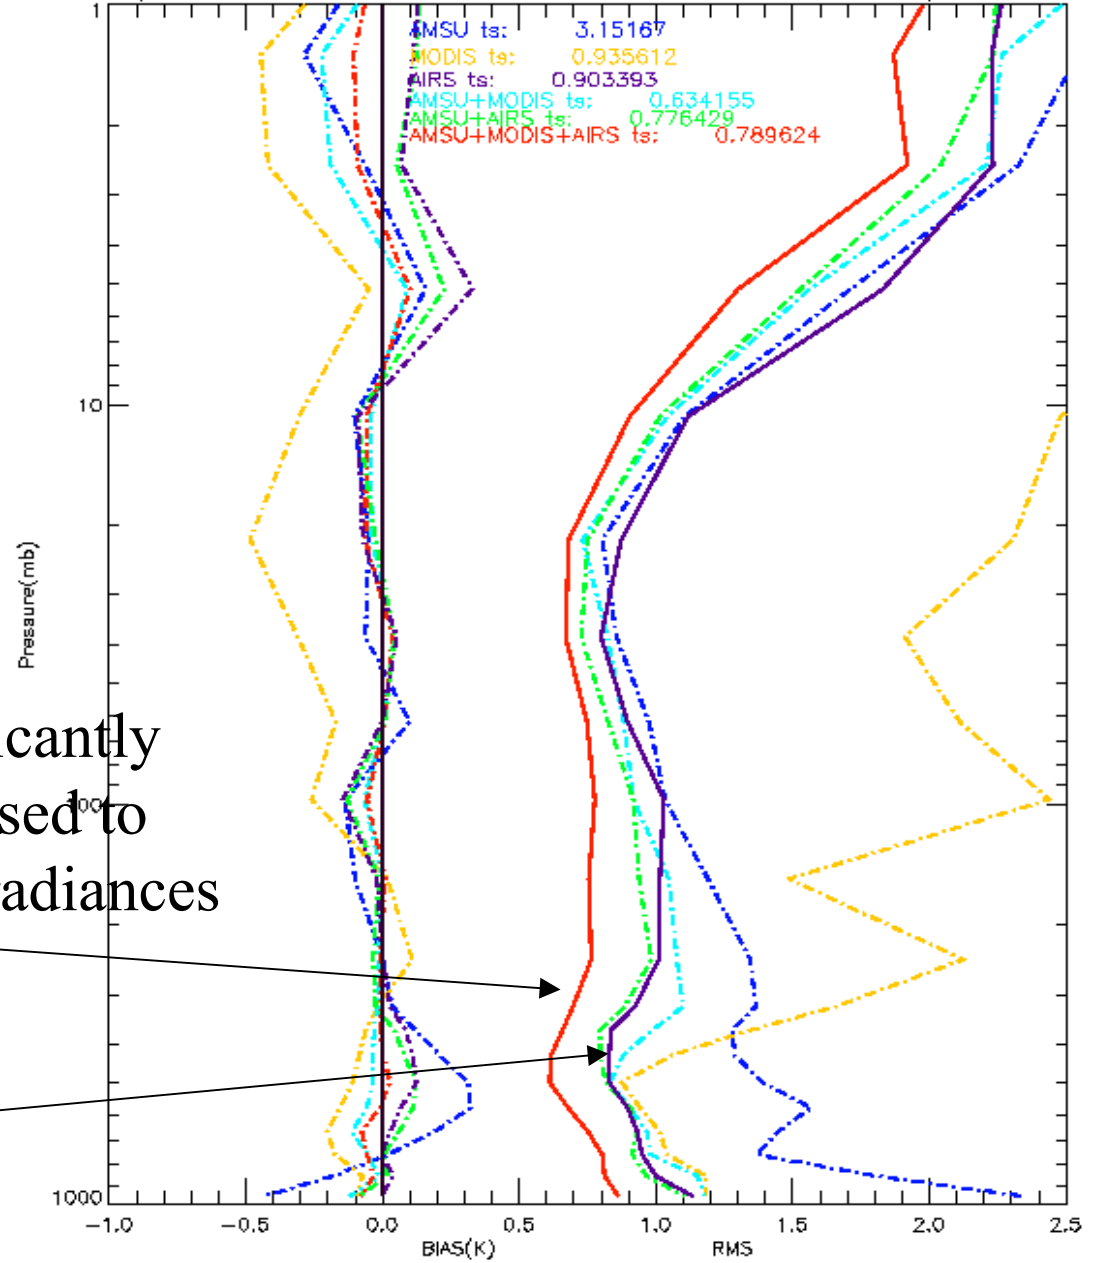

OCT,10, 2004, Ocean, Ascending, -40 to 40

All-sky minus clear simulated (ECMWF)

Temp Retrieval Bias/RMS (ECMWF), Oct. 10, 2004, r1 noc33, sample=4942.00

Retrieval errors are significantly reduced after MODIS is used to QC AIRS cloud-cleared radiances

W/O QC

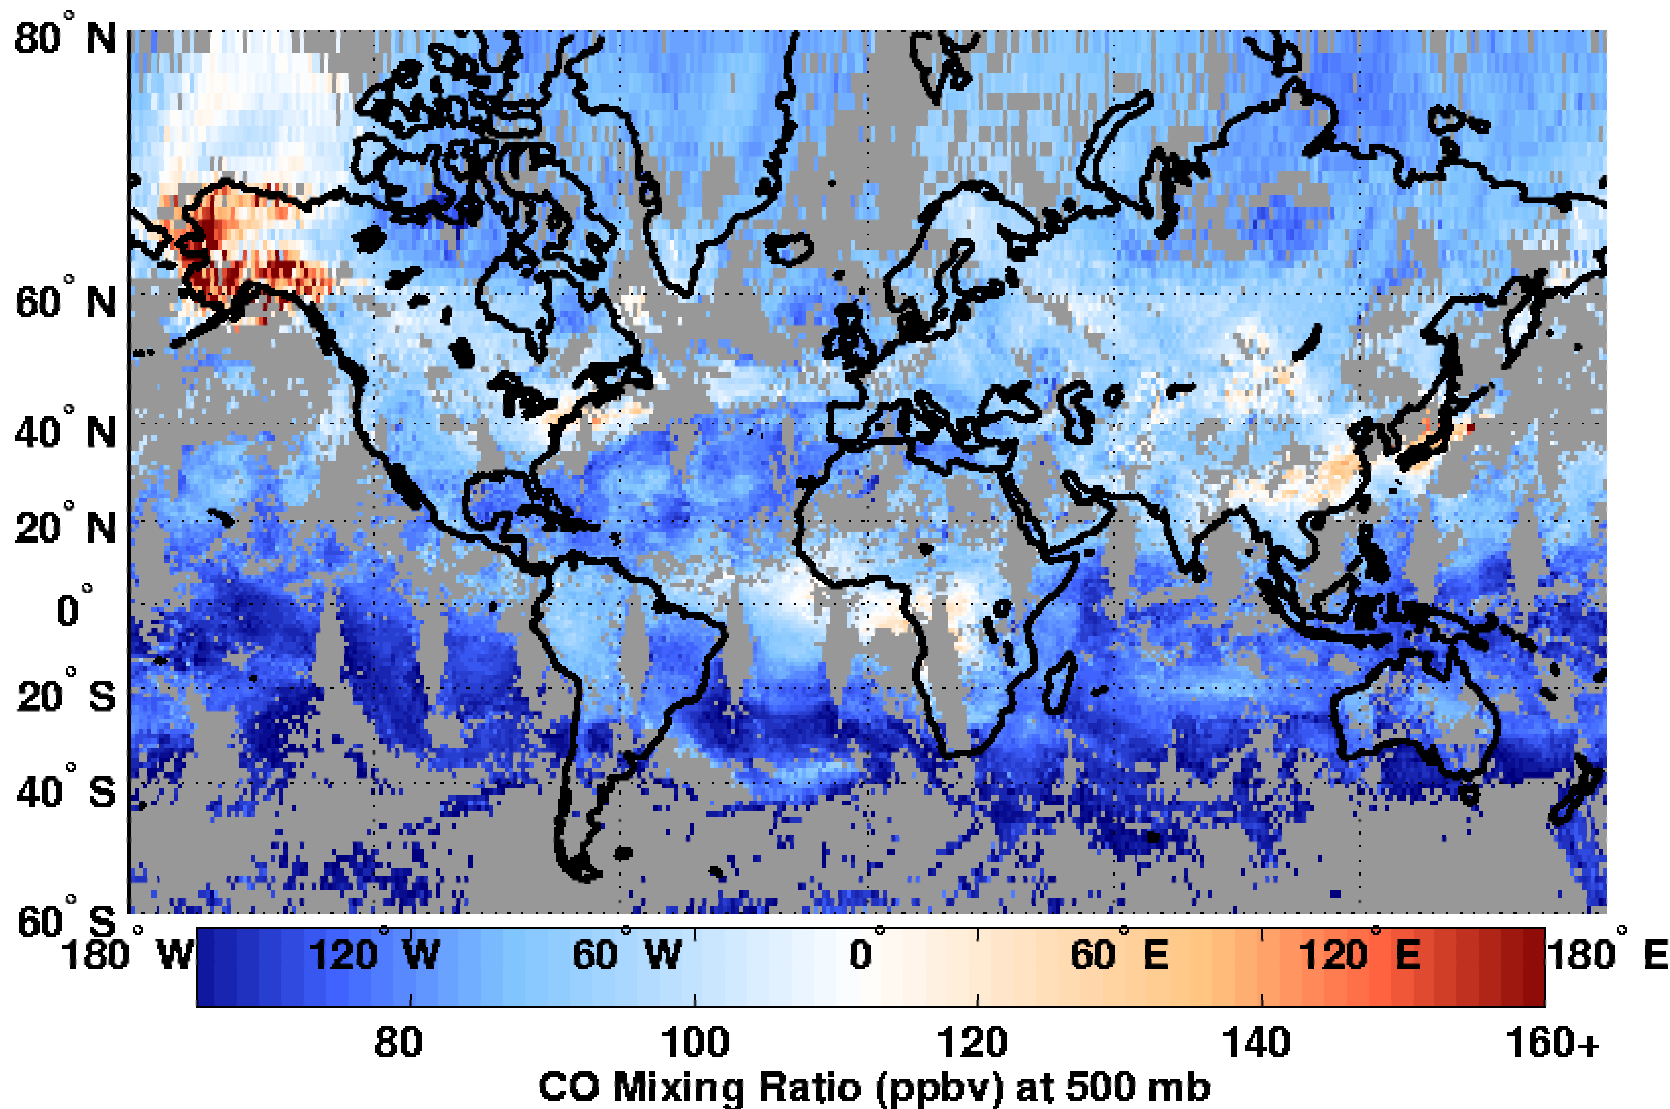

Carbon Products

July 2004 AIRS Daily Global CO

AIRS CO at 500 mb on 20040701

3°x3° grids trace gas movie – very preliminary

20030801_TO_20030831 All Cases CO₂ between 328mb - 777mb

CO₂ mixing ratio, ppmv

20030801_TO_20030831 All Cases CO between 407mb - 515mb

CO mixing ratio, ppbv

20030801_TO_20030831 All Cases O₃(p) Total Column

O₃ column density, DU

20030801_TO_20030831 All Cases CH₄ between 300mb - 407mb

CH₄ mixing ratio, ppbv

Validating Models

- Assumption is AIRS is very accurate.
- AIRS spectrally-resolved radiances can be used to validate model analyses.

Total Precip Water (mm), Sept. 2003

ECMWF

mean=23.2159, stdv=14.4149

GDAS

mean=24.1483, stdv=14.8546

GDAS-ECMWF

bias=0.932347, rms=1.77488

Total Precip Water (mm), Sept. 2004

ECMWF

mean=23.2858, stdv=14.1998

GDAS

mean=24.437, stdv=14.3881

GDAS-ECMWF

AIRS is assimilated by
ECMWF

West Tropical Pacific

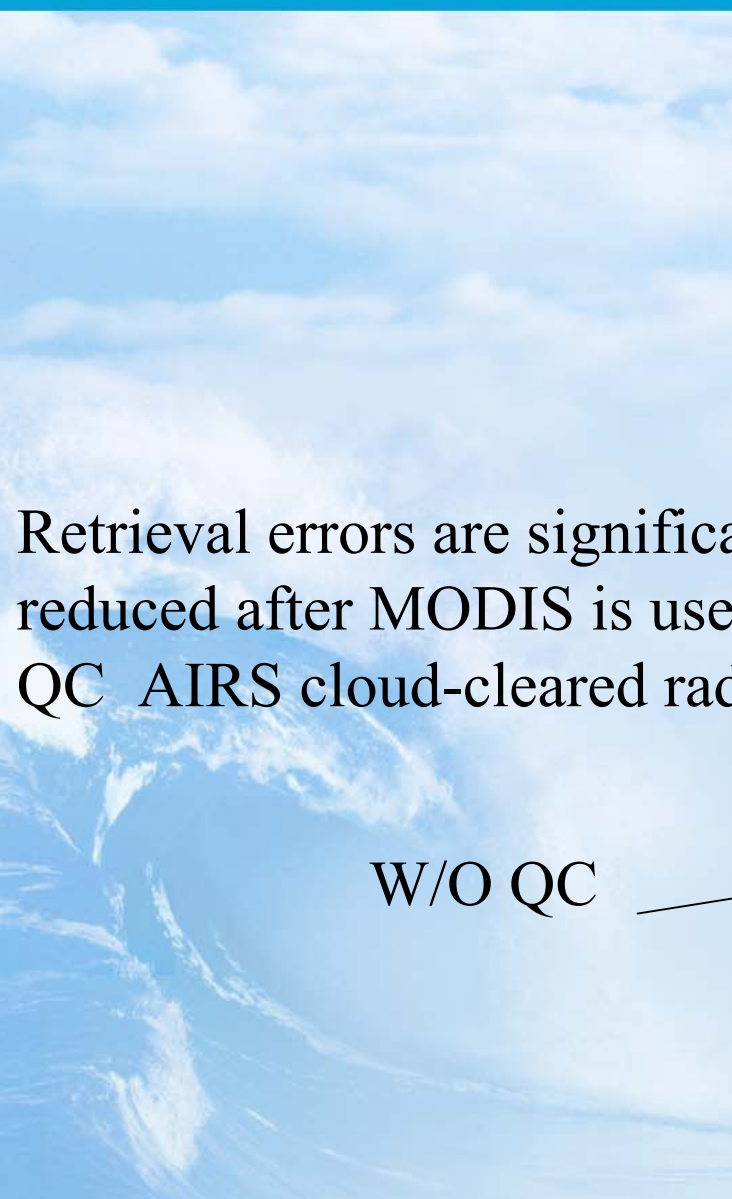

Central Pacific Subtropical Zone

Summary

- NESDIS will provide operational radiance and level 2 and level 3 products for IASI and CrIS
- Need to integrate high spectral resolution infrared observations and high spatial imager data to provide the most accurate products.
- Research/application areas over the next few years should focus on the use of cloud cleared, the assimilation of cloudy radiances, and the development and validation of trace gases

Retrieval errors are significantly reduced after MODIS is used to QC AIRS cloud-cleared radiances

W/O QC
