¹RESOLUTION 810 (WRC-15) Preliminary agenda for the 2023 World Radiocommunication Conference

WRC-23 agenda¹

“WRC-19 decisions must ensure that satellite communications can meet the demands of the communities and customers they serve, by maintaining and expanding access to harmonized spectrum resources. This includes the Ku-band, Ka-band, Q/V-band, E-band, and the C-band in which IMT is seeking identifications at WRC-19, and in national consultations. Harmonized spectrum in these bands is critical for the provision of communication services via satellite — including the expanding mobile and broadband connectivity needs that are uniquely met by satellites.

The satellite industry will propose that the World Radiocommunication Conference in 2023 (WRC-23) consider further changes to help achieve these objectives by taking advantage of the unique and increasing advantages of satellite communications. “

Possible WRC-23 agenda item

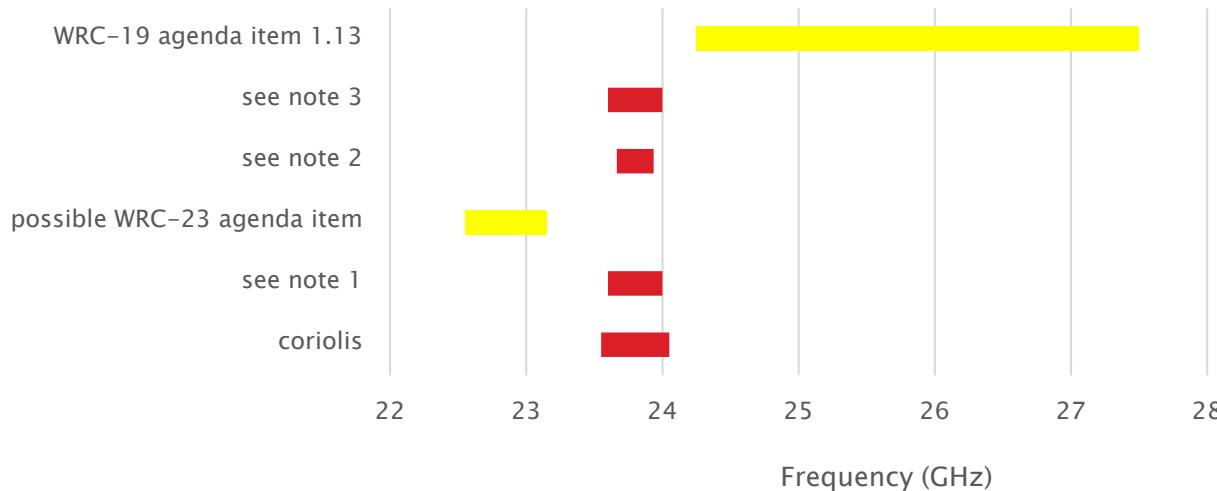

“...examine the compatibility of fixed-satellite systems with terrestrial services allocated in the so-called “E-band” between 71–76 GHz and **81–86 GHz**. Access to the E-band spectrum by fixed-satellite services would further bolster the broadband capacity delivered by satellite networks, improve connectivity speeds to end users, and position satellite services as an alternative or complementary platform to terrestrial networks for big-data applications.”¹

Several EESS passive systems use 86 – 92 GHz: **Aqua , GPM Core Observatory , Metop-A , Metop-B , Metop-C , NOAA-15 , NOAA-18 , NOAA-19, Suomi NPP, NOAA-20**
