CPTEC/INPE (Brazil)	See Table 3 (retrievals)																										

NOTE: All centers reject some channels from certain satellites for which the radiance data are known to be bad. These details are not provided here.

CODES

- G** global
- R** regional
- GD** global deterministic
- RD** regional deterministic
- GE** global ensemble
- RE** regional ensemble

- off-line dynamic**
- variational**
- HK**
- sea/lo topo**
- CLW**

bias corrections updated and applied to data before each analysis
e.g. VarBC where bias corrections are computed during variational analysis as part of minimization
Harris Kelly type bias correction (thickness predictors)
assimilated over ocean and low topography land
cloud liquid water

NOTES

- 1 Thinning to be reduced to 150 km (currently being tested)
 - 2 Bias correction is off-line static for AMSU-A channels 11-14
 - 3 AMSU-B/MHS assimilation is being tested
 - 4 Start with taking every 4th point along scan, from every other scan line (skipping pattern to sample every scan point), then further reduce to approximately 140 km.
 - 5 VarBC code developed, to be tested this spring.
 - 6 Switch to an online bias correction scheme soon
 - 7 Channels 4-5 not assimilated over sea ice
 - 8 AMSU-A ch. 5-6 not assimilated over sea ice
 - 9 AMSU-A channels in range 5-13 not assimilated: N15 (6,11) N16 (5-10,12) AQ (5-7) MO (7)
 - 10 Calibration and for RARS data removal of antenna correction (G), Calibration (R)
 - 11 Bias correction soon to become offline adaptive
 - 12 Calibration and pre-processing via AAPP at Met Office.
- Cloud detection, land/sea/ice determination in OPS pre-processor as part of Met Office UM suite.

CPTEC/INPE (Brazil)	N/A	YES	GD	NESDIS	Thickness	Standard levels	100 km		NO

Table prepared by ITWG/NWP WG

NOTES

- 1 Run 1D-var prior to assimilation which analyses skin temperature and for advanced IR sounders cloud cover which is used in the forward calculations 4D-var. Soon this will also be used to analyse emissivity.
