

# PREPARING FOR AND EVALUATING THE ARCTIC WEATHER SATELLITE DATA IN THE NORDIC LIMITED-AREA NUMERICAL WEATHER PREDICTION SYSTEMS

ITSC-24: Tromsø Norway, 16-22 March 2023

**Magnus Lindskog**, Adam Dybbroe, Bjarne Amstrup, Trygve Aspenes, Roohollah Azad, Vasileios Barlakas, Mats Dahlbom, Per Dahlgren, Reima Eresmaa, Patrick Eriksson, Stephanie Guedj, Susanna Hagelin, Hanna Hallborn, Annakaisa von Lerber, Máté Mile, Ewan O'Connor, Adriaan Perrels, Lars Ørum Rasmussen, Timo Ryyppö, Harald Schyberg, David Schönach, Rasmus Tonboe

# Structure

- The Arctic Weather Satellite (AWS)
- ESA AWS project overview
- Preparation of the regional numerical weather prediction (NWP) system
- Constellation impact studies
- Results
- Conclusions

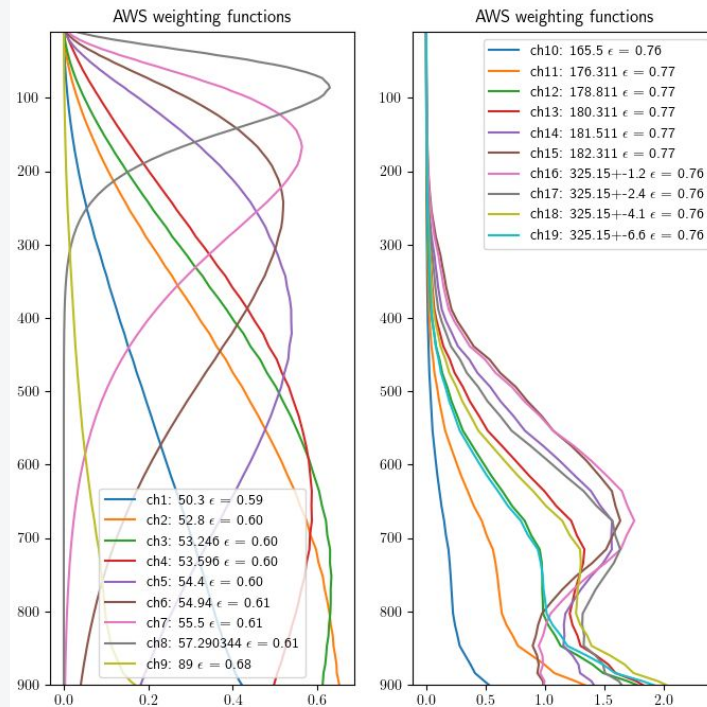

## EPS-Sterna

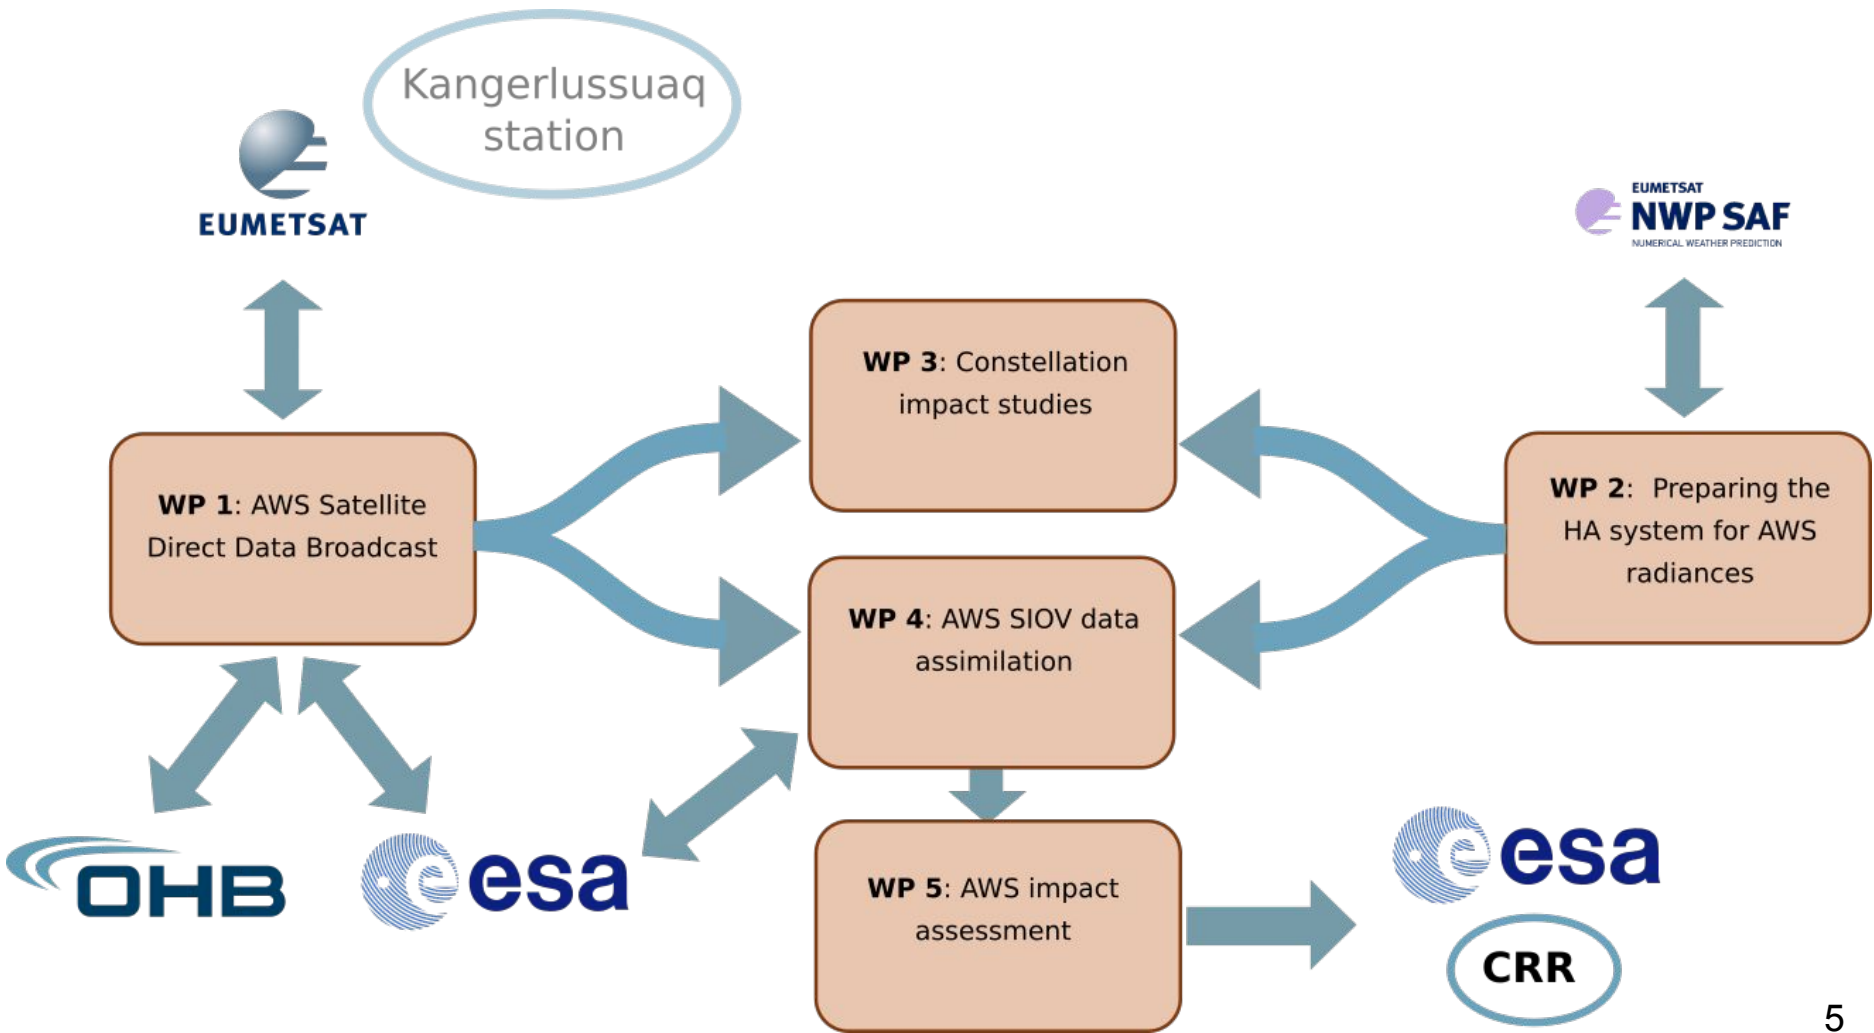

- 6 satellites in 3 different orbital planes
- Complementing the Metop & JPSS
- Giving high temporal coverage - down to ~30 minute over the Arctic

# The AWS instrument

- Passive Microwave Radiometer
- Cross-track scanner (~2000 km swath)
- Strong heritage to MHS/AMSU-A and ATMS (and MWS)
- 19 channels for temperature and humidity sounding + clouds
- 4 new sub-mm bands around 325 GHz for humidity sounding and clouds

# Nordic ground Segment Coverage

AWS horizons, seen from the four stations

Norrköping

Oslo

Sodankylä

Kangerlussuaq

## The HARMONIE-AROME regional numerical weather prediction (NWP) system and Nordic domains

MetCoOp and Arome-Arctic

Danish/Icelandic operational

Planned UWC-west domains

**65 vertical model levels, 2.5 km horizontal grid-distance,  
data-assimilation using 3D-Var or 4D-Var**

## **Preparing The HARMONIE-AROME NWP system for AWS data**

- Technical preparation for reading and processing of AWS data.
- Enhanced use of low-peaking microwave channels.
- Representation of satellite footprint in model equivalent.
- Towards all-sky assimilation.
- Use of 325 GHz channel.

# Surface-sensitive data

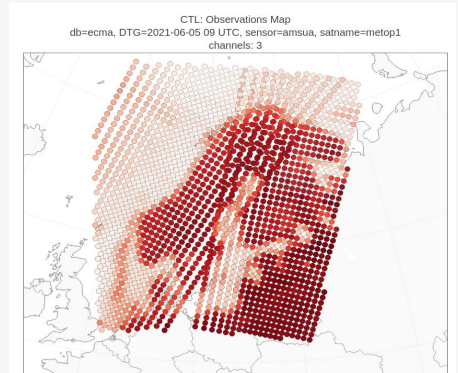

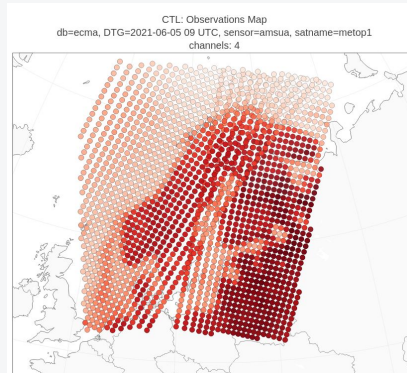

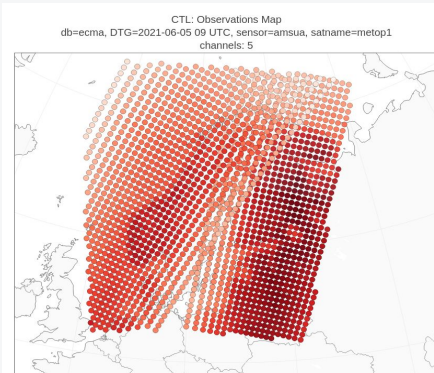

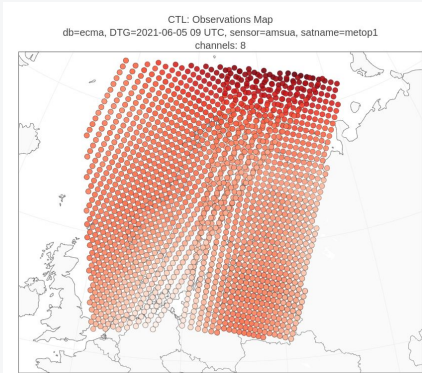

For low-peaking channels, the mixed signal coming from both the atmosphere and the surface requires an adequate representation of the surface temperature & emissivity in radiance space.

AMSU-A ch 9 Sounding (~8km)

... AMSU-A ch 5 Sounding (~4km)

AMSU-A ch 4 Sounding (~1km)

AMSU-A ch 3 Window

The peak of the channel weighting functions decreases in altitude (reduction of atmospheric absorption)

## Dynamical emissivity approach

OBSERVATIONS

SIMULATIONS

# Representing satellite radiance footprint

Default assimilation as **Point observations**

Satellite observation operator:  
**Footprint operator**

- If using AWS radiances as point observations, the HARMONIE-AROME data assimilation will suffer spatial representation errors.
- A footprint operator can improve the high-resolution data assimilation by computing an averaged model equivalent under the satellite footprint.
- The footprint representation help to take into account sub-footprint heterogeneity.

Simulated Tb and retrieved emissivity over mixed surface

# Impact of enhanced used of low-peaking channels

Two sets of parallel experiments of Nordic domain to evaluate the effect of low peaking channels. One in 3D-Var and one in 4D-Var framework. Period: February 2021. Forecasts up to 36h.

**CRL:** reference experiment using conventional and various types of satellite-based observations

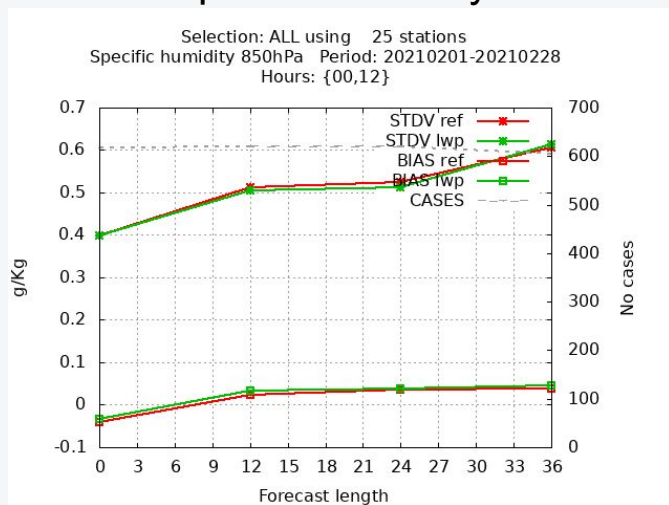

**EXP:** low peaking channel experiment using dynamic emissivities over land and sea-ice, in which which also channel 5 is used both for AMSU-A and MHS

Results show a slightly positive impact from use of low peaking channels on forecasted humidity and winds (4D-Var). Results obtained for both short (1-3 h, see below) and long forecast ranges.

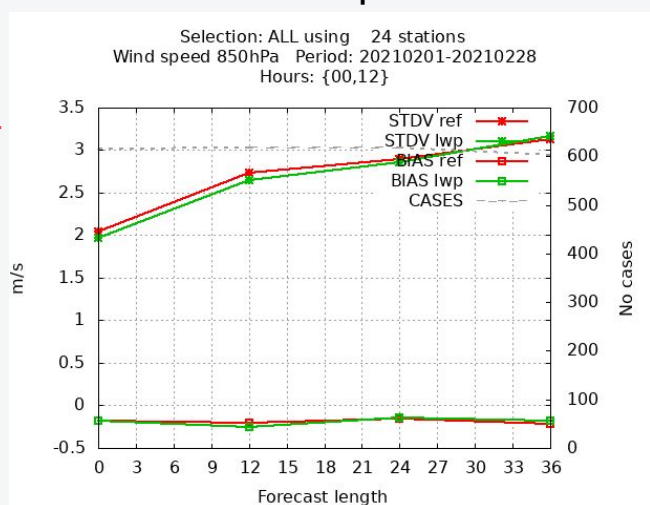

## Standard deviations and bias for verification of 4D-Var based forecasts at 850 hPa

Specific humidity against radiosondes. Wind speed

CRL

EXP

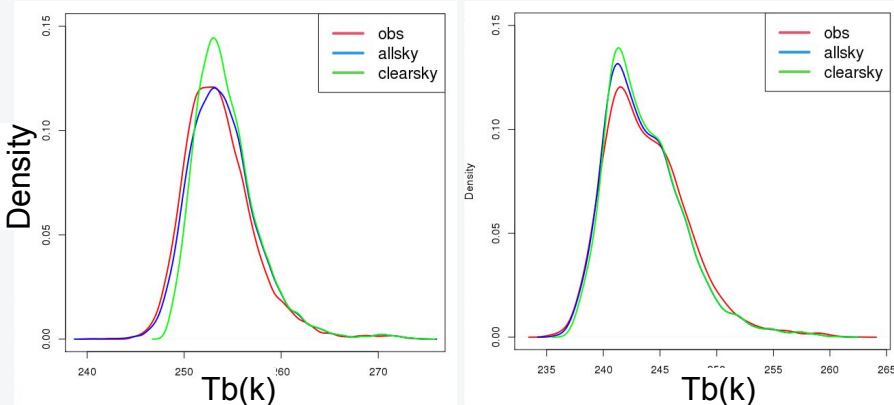

# Towards all-sky

Activation and evaluation of all-sky functionality in HARMONIE-AROME on-going, starting with the MHS instrument. Adaptations towards HARMONIE-AROME micro-physics.

## HARMONIE-AROME all-sky

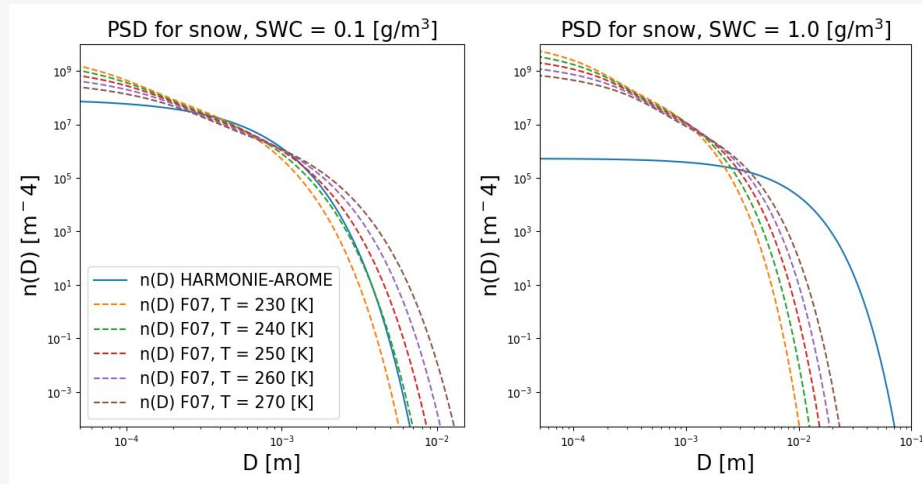

All-weather radiances from MHS assimilated in Harmonie-Arome 3DVAR with ECMWF all-sky approach using `rttov_scatt` observation operator, no hydrometeors in the control variables so all-sky assimilation will change temperature and humidity fields. *Observed (red), model allsky (blue), and model clear-sky (green) brightness temperature for MHS channel 3 and 4.*

On-going investigation of the importance of particle size distributions (PSD) of hydrometeors in all-sky assimilation

Comparison of RTTOV and HARMONIE-AROME snow particle size distributions

**F07:** PSD used in RTTOVv13 (Field et al. 2007)

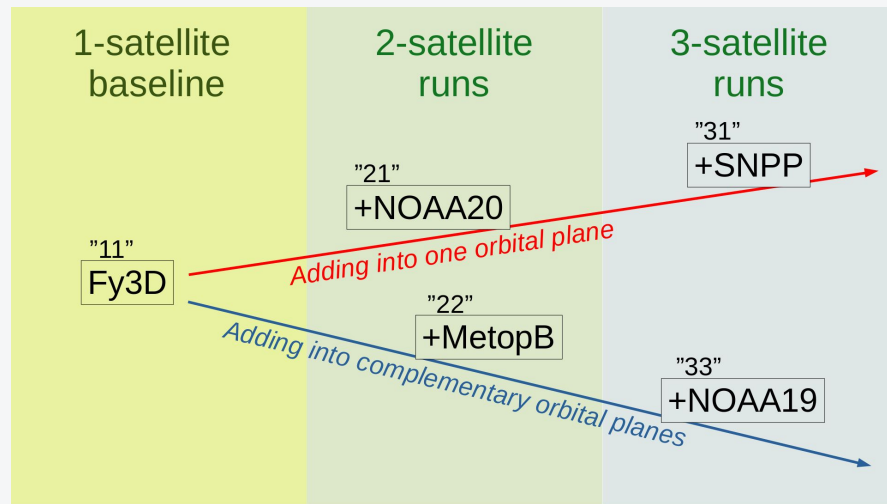

# Using heritage MW sounders to demonstrate the benefit of multiple satellites in regional NWP

**Objective:** Quantify the incremental benefit from adding MW-sounding satellites one-by-one either into *one single orbital plane* or into *complementary orbital planes*

We will produce two streams of 8-week experiments using 4D-Var data assimilation:

- 1) A winter period 14 Dec 2020 – 7 Feb 2021 using the MetCoOp operational domain
- 2) A summer period 15 Jun 2020 – 9 Aug 2020 using the Arome-Arctic operational domain

The five experiments in each stream are all in production at present

# Summary

- Within an ESA-funded project, the HARMONIE-AROME regional NWP system is being prepared for assimilation of AWS data.
- The nordic ground segment include the four receiver stations of Kangerlussuaq, Oslo, Sodankylä and Norrköping.
- Project results regarding enhanced use of low peaking channels from MW instruments have been proven beneficial and already reached operations. Further enhancements are ongoing.
- Constellation impact studies are in production.
